The purpose of this test was to demonstrate that the alternator stator has satisfactorily completed sufficient testing to satisfy the requirements set forth within the Kilowatt Isotope Power System KIPS Component Test Specification for the GDS Alternator Stator TS 2538 The results of the acceptance tests conducted on the alternator stator S N 003 are presented and show that the stator did meet specified requirements **PERFORMANCE TEST OF 220-v THREE-PHASE STATOR FOR USE WITH 5-gpm IN-PILE LOOP PUMP.** ,1957 On the Possibility of Motor Winding Impulse Tests Increasing Stator Core Losses J. The Rotating Stator Concept Preliminary Calibration of the Compressor in the Conventional Configuration M. S. Chappell,National Research Council of Canada,1970 The background and objectives of an extensive program of research into a novel concept of co rotating stator rows within an axial compressor are outlined The test compressor to be used in the experimental investigations is described in detail as is the NRC Compressor Test Facility wherein the tests are conducted The major portion of this initial report comprises results from the preliminary calibration of the three stage test compressor operated in the conventional configuration i e with the stator rows stationary This datum performance run was prematurely terminated by a drive train failure but some useful data were obtained at speeds up to about eighty percent of the design value These data are compared with results from a previous series of tests on another compressor of the same aerodynamic design The correlation of overall performance parameters was acceptable but individual stage characteristics required considerable adjustment to obtain satisfactory agreement with previous results Author *Torque limit bench tests of stator anti-rotation keys for bj-can2 and bj-std primary circulating pump seal packages* R. Larose,1980 *The Physical Phenomena Associated with Stator Winding Insulation Condition as Detected by the Ramped Direct High-voltage Method* Lorelynn Mary Rux,2004 Deregulation of the electric utility industry has increased the need to monitor the state of powerplant equipment such as critical generators and motors to improve availability and reduce life cycle costs via condition based maintenance To achieve these goals nondestructive condition assessment and diagnostic tests are necessary to

evaluate the quality and condition of a machine's stator winding insulation system. Periodic tests are generally conducted to monitor insulation aging, diagnose problems, or provide some assurance that the winding has a minimum level of electrical strength. The basic principles of insulation testing are presented herein, and the physical mechanisms that affect the current versus voltage response are described. A stator winding insulation model was developed based on this theoretical foundation for use in understanding and analyzing the macroscopic behavior of complex insulation phenomena. A comprehensive controlled laboratory experiment was conducted on a set of stator coils that were deliberately manufactured with and without insulation defects. Specific defects were chosen to represent the types of insulation problems typically encountered during manufacture or as a result of in-service aging and included lack of resin cure, loosely applied insulating tapes, internal conductive contamination, reduced density of the groundwall insulation, and thermal cycling damage. Results are presented from a series of electrical tests conducted on the coil specimens to compare the effectiveness of various test methods in detecting the different insulation problems. The tests included insulation resistance, polarization index, ramped direct voltage, dissipation factor, dielectric spectroscopy, partial discharge, and recovery voltage measurements. Dielectric principles and testing experience obtained during this investigation were applied to a collection of test results obtained by the author from in-service machines during the past ten years. These results and analyses provide a practical illustration of the ability of the ramped direct high voltage test method to distinguish between normal insulation and that with problems and to help identify the cause and extent of the deficiencies. While no single diagnostic method is ideally suited to detect all possible stator winding insulation problems, ramped voltage tests are shown to be useful in determining when corrective actions are needed and what the appropriate actions are.

Two-dimensional Cold-air Cascade Study of a Film-cooled Turbine Stator Blade Thomas P. Moffitt, 1974 The effect of film coolant ejection from the pressure side of a stator blade was determined in a two dimensional cascade. Stator exit surveys were made for each of six rows of coolant holes. Successive multirow tests were made with two three four five and six rows of coolant holes open. The results of the multirow tests are compared with the predicted multirow performance obtained by adding the single row data. Results are presented in terms of stator primary air efficiency as a function of coolant fraction.

Detecting Stator and Rotor Winding Faults in Three-phase Induction Machines Jeffrey C. Robertson, C. M. Ong, 1995 Abstract The purpose of this work is to investigate the efficiency of existing methods for on line fault detection when applied to three phase induction motors specifically to test known theoretical calculations of harmonics developed by certain types of faults experimentally. The work involves the development of equipment and test procedures needed and research of existing methods of fault detection. The experiments are conducted by planting a fault in a test induction machine and then performing a Fast Fourier Transform FFT on the line current. The processed data are then compared with those from the same test machine before the fault was planted. Recognition of fault type is based on differences in spectra signatures on the line currents of the faulted and healthy machines. This method potentially may be applied to other types of machines.
