

Thermal decomposition reactions are examples of endothermic reactions.

What are the two ways that show that a reaction is endothermic?

Investigating temperature changes

You can use a poly(styrene) cup and a thermometer to investigate the temperature changes in reactions involving at least one solution. Record the initial temperatures of any solutions and the maximum or minimum temperature reached in the course of the reaction.

The thermometer is used to measure the temperature change which takes place during the reaction.

Reactants are mixed in the cup. The insulation provided by the poly(styrene) cup reduces the rate at which energy is transferred to or from the reaction mixture.
