

## Neuron Structure: What are the essential structures that make up a neuron?

### Why?

Cells are specialized for different functions in multicellular organisms. In animals, one unique kind of cell helps organisms survive by collecting information and sending messages throughout the body. The shapes and features of neurons, which are the primary cells in the nervous system, enable animals to experience all of the five senses; find food, mates, and shelter; and to survive in their diverse environments.

**Model 1 – Parts of a Neuron**

- Model 1 is an illustration of two neurons. Label one of the neurons in the diagram with the following structures:

Cell body or soma	Axon
Cell nucleus	Synapse
Dendrites	

- Which structure(s) on the neuron in Model 1 would receive a signal from either a sensory cell (taste bud, touch receptor, retinal cell) or from another neuron?
- Draw an arrow through the two cells in Model 1 to show the path of a nerve impulse if a message was being sent through the two neurons.

**Model 2 – Membrane Potential**

- Describe the cellular structure shown in detail in Model 2.

- Identify each of these symbols in Model 2.

- Consider Model 2.

- Which side of the membrane has more sodium ions when the neuron is at rest?
- Briefly explain why sodium ions cannot cross the membrane without the use of a protein channel.
- Which direction should sodium ions flow naturally if a channel is provided?

I. Poljakov,1972      *Neuron Structure-function Correspondence as Revealed by Biological Scaling Theory* Paheli Desai-Chowdhry,2023 Neurons are connected by complex branching processes that collectively process information for organisms to respond to their environment Classifying neurons according to differences in structure or function is a fundamental piece of neuroscience Here by constructing new biophysical theory and testing against our empirical measures of branching structure we establish a correspondence between neuron structure and function as mediated by principles such as time or power minimization for information processing as well as spatial constraints for forming connections Based on these principles we use Lagrange multipliers to predict scaling ratios for axon and dendrite sizes across branching levels We test our predictions for radius scale factors against those extracted from images measured for species that range from insects to whales Notably our findings reveal that the branching of axons and peripheral nervous system neurons is mainly determined by time minimization while dendritic branching is mainly determined by power minimization Further comparison of different dendritic cell types reveals that Purkinje cell dendrite branching is constrained by material costs while motoneuron dendrite branching is constrained by conduction time delay We extend this model to incorporate asymmetric branching where there are multiple different paths from the soma to the synapses and thus multiple interpretations of conduction time delay one considers the optimal path and the other considers the sum of all possible paths leading to different predictions We find that the data for motoneurons show a distinction between the asymmetric and symmetric branching junctions corresponding to predictions using different interpretations of the time delay constraint Moreover the more asymmetric branching junctions are localized near the synapses indicating that different functional principles affect the structure at different regions of the cell Finally we use machine learning methods to classify cell types using functionally relevant structural parameters derived from our model Incorporating branching level as a feature in classification in addition to parameters related to information flow improves performance across methods suggesting that information flow drives localized differences in morphology Future directions of this work include estimating specific parameters related to functional tradeoffs and myelination using numerical optimization and analyzing changes across stages of development      *Advancing Our Understanding of Structure and Function in the Brain: Developing Novel Approaches for Network Inference and Emergent Phenomena* Chris G. Price, Andrew P. Jarman, John O. Mason, Peter C. Kind, 2011-07-22 The development of a brain from its simple beginnings in the embryo to the extraordinarily complex fully functional adult structure is a truly remarkable process Understanding how it occurs remains a formidable challenge despite enormous advances over the last century and current intense world wide scientific research A greater knowledge of how nervous systems construct themselves will bring huge benefits for human health and future technologies Unravelling the mechanisms that lead to the development of healthy brains should help scientists tackle currently incurable diseases of the nervous system such as autism epilepsy and schizophrenia to name but a few discover more about the processes that cause the uncontrolled growth associated with cancer and develop possible treatments Building Brains provides a highly visual and readily accessible introduction to the main events that occur during neural development and the mechanisms by which they occur Aimed at undergraduate students and postgraduates new to the field who may not have a background in neuroscience and/or molecular genetics it explains how cells in the early embryo first become neural how their proliferation is controlled what regulates the types of neural cells they become how neurons connect to each other how these connections are later refined under the influence of neural activity including that arising from experience and why some neurons normally die Key Features A concise illustrated guide focusing on the core elements of current understanding of neural development emphasising common principles underlying developmental mechanisms and supplemented by suggestions for further reading Text boxes throughout provide further detail on selected major advances issues of particular uncertainty or controversy and examples of human diseases that result from abnormal development A balanced mammalian

**Foundations of the Neuron Doctrine** Gordon M. Shepherd, 1991 For a century the neuron doctrine has been the basis for our concepts of nervous organization and brain function Formulated in 1891 by Wilhelm Waldeyer it stated that the cell theory applies to the nervous system Santiago Ramon y Cajal Spain's greatest scientist was its main architect his main tool was a capricious nerve cell stain discovered by Camillo Golgi This book reviews the original papers on which the neuron doctrine was based showing that the evidence came from a much wider base of contributions than is generally realized including such diverse and brilliant personalities as Albrecht Kolliker Sigmund Freud Wilhelm His August Forel Fridtjof Nansen and Gustav Retzius Furthermore many questions about terminology of the parts of the neuron and about the organization of neurons into reflex pathways and networks were raised and debated questions that remain relevant to this day Electron microscopical studies in the 1950s appeared to confirm the classical doctrine but subsequent studies have revealed complexities that were not anticipated This book reviews these new studies against the background of the classical work and suggests some new directions for revising our concept of the neuron as a basis for the functional organization of the nervous system
