cDNA Library Protocols Ian G. Cowell, Caroline A. Austin, 2008-02-02 The first libraries of complementary DNA cDNA clones were constructed in the mid to late 1970s using RNA dependent DNA polymerase

reverse transcriptase to convert poly A mRNA into double stranded cDNA suitable for insertion into prokaryotic vectors Since then cDNA technology has become a fundamental tool for the molecular biologist and at the same time some very significant advances have occurred in the methods for constructing and screening cDNA libraries It is not the aim of cDNA Library Protocols to give a comprehensive review of all cDNA library based methodologies instead we present a series of up to date protocols that together should give a good grounding of procedures associated with the construction and use of cDNA libraries In deciding what to include we endeavored to combine up to date versions of some of the most widely used protocols with some very useful newer techniques cDNA Library Protocols should therefore be especially useful to the investigator who is new to the use of cDNA libraries but should also be of value to the more experienced worker Chapters 1-5 concentrate on cDNA library construction and manipulation Chapters 6 and 7 describe means of cloning difficult to obtain ends of cDNAs Chapters 8-18 give various approaches to the screening of cDNA libraries and the remaining chapters present methods of analysis of cDNA clones including details of how to analyze cDNA sequence data and how to make use of the wealth of cDNA data emerging from the human genome project
