

SL Paper 3

An experiment to find the internal resistance of a cell of known emf is to be set. The following equipment is available:

- Draw a suitable circuit diagram that would enable the internal resistance to be determined. [1]
- It is noticed that the resistor gets warmer. Explain how this would affect the calculated value of the internal resistance. [3]
- Outline how using a variable resistance could improve the accuracy of the value found for the internal resistance. [2]

To determine the acceleration due to gravity, a small metal sphere is dropped from rest and the time it takes to fall through a known distance and open a trapdoor is measured.

The following data are available:

Diameter of metal sphere	$= 12.0 \pm 0.1 \text{ mm}$
Distance between the point of release and the trapdoor	$= 654 \pm 2 \text{ mm}$
Measured time for fall	$= 0.363 \pm 0.002 \text{ s}$

- Determine the distance fallen, in m, by the centre of mass of the sphere including an estimate of the absolute uncertainty in your answer. [2]
- Using the following equation [4]

$$\text{acceleration due to gravity} = \frac{2 \times \text{distance fallen by centre of mass of sphere}}{(\text{measured time to fall})^2}$$

calculate, for these data, the acceleration due to gravity including an estimate of the absolute uncertainty in your answer.
