Weiglhofer, Akhlesh Lakhtakia, 2003 Complex mediums electromagnetics CME describes the study of electromagnetic fields in materials with complicated response properties This truly multidisciplinary field commands the attentions of scientists from physics and optics to electrical and electronic engineering from chemistry to materials science to applied mathematics biophysics and nanotechnology This book is a collection of essays to explain complex mediums for optical and electromagnetic applications All contributors were requested to write with two aims first to educate second to provide a state of the art review of a particular subtopic The vast scope of CME exemplified by the actual materials covered in the essays should provide a plethora of opportunities to the novice and the initiated alike      **Electrical & Electronics Abstracts**, 1988      **Optics of Conducting Polymer Thin Films and Nanostructures** Shangzhi Chen, 2021-02-19 Intrinsically conducting polymers forms a category of doped conjugated polymers that can conduct electricity Since their discovery in the late 1970s they have been widely applied in many fields ranging from optoelectronic devices to biosensors The most common type of conducting polymers is poly 3 4 ethylenedioxythiophene or PEDOT PEDOT has been popularly used as electrodes for solar cells or light emitting diodes as channels for organic electrochemical transistors and as p type legs for organic thermoelectric generators Although many studies have been dedicated to PEDOT based materials there has been a lack of a unified model to describe their optical properties across different spectral ranges In addition the interesting optical properties of PEDOT based materials benefiting from its semi metallic character have only

been rarely studied and utilized and could potentially enable new applications Plasmonics is a research field focusing on interactions between light and metals such as the noble metals gold and silver It has enabled various opportunities in fundamental photonics as well as practical applications varying from biosensors to colour displays This thesis explores highly conducting polymers as alternatives to noble metals and as a new type of active plasmonic materials Despite high degrees of microstructural disorder conducting polymers can possess electrical conductivity approaching that of poor metals with particularly high conductivity for PEDOT deposited via vapour phase polymerization VPP In this thesis we systematically studied the optical and structural properties of VPP PEDOT thin films and their nanostructures for plasmonics and other optical applications We employed ultra wide spectral range ellipsometry to characterize thin VPP PEDOT films and proposed an anisotropic Drude Lorentz model to describe their optical conductivity covering the ultraviolet visible infrared and terahertz ranges Based on this model PEDOT doped with tosylate PEDOT Tos presented negative real permittivity in the near infrared range While this indicated optical metallic character the material also showed comparably large imaginary permittivity and associated losses To better understand the VPP process we carefully examined films with a collection of microstructural and spectroscopic characterization methods and found a vertical layer stratification in these polymer films We unveiled the cause as related to unbalanced transport of polymerization precursors By selection of suitable counterions e.g. trifluoromethane sulfonate OTf and optimization of reaction conditions we were able to obtain PEDOT films with electrical conductivity exceeding 5000 S cm In the near infrared range from 1 to 5  $\mu$ m these PEDOT OTf films provided a well defined plasmonic regime characterized by negative real permittivity and lower magnitude imaginary component Using a colloidal lithography based approach we managed to fabricate nanodisks of PEDOT OTf and showed that they exhibited clear plasmonic absorption features The experimental results matched theoretical calculations and numerical simulations Benefiting from their mixed ionic electronic conducting characters such organic plasmonic materials possess redox tunable properties that make them promising as tuneable optical nanoantennas for spatiotemporally dynamic systems Finally we presented a low cost and efficient method to create structural colour surfaces and images based on UV treated PEDOT films on metallic mirrors The concept generates beautiful and vivid colours through out the visible range utilizing a synergistic effect of simultaneously modulating polymer absorption and film thickness The simplicity of the device structure facile fabrication process and tunability make this proof of concept device a potential candidate for future low cost backlight free displays and labels
