writing Hypothetical and real world case studies on ethical issues and measures for prevention and control **Neurogenic
bladder and bowel dysfunction** Peter Wide,2020-09-11 Spinal dysraphism SD is a congenital malformation that to a
varying extent often severely affects the life of the child and the family Most individuals with SD suffer from neurogenic
bladder and bowel dysfunction with the risk of urinary tract infections renal deterioration urinary and fecal incontinence that
affects social participation and quality of life negatively In newborns with SD early detection of neurogenic bladder
dysfunction and determination of post void residual urine are required to determine the need of clean intermittent
catheterization CIC and follow up The non invasive method of four hour voiding observation with provocation test VOP was
used to evaluate bladder function in 50 newborn children with SD Voiding patterns for the children were described and
compared with those of 50 healthy newborns evaluated with VOP in an earlier study Comparison revealed significant
differences among several variables In particular leakage at provocation test and not voiding with a stream were common in
newborns with SD but did not occur in healthy newborns VOP is a non invasive standardized method to determine residual
urine in newborns with SD It also adds information on voiding pattern frequency voiding with a stream and leakage at
provocation Findings in neonatal VOP of the same cohort of newborns with SD were then related to radiology presence of
urinary tract infections during the first year and urodynamic findings and use of CIC at the age of one year It was found that
in children with SD not voiding with a stream may have a predictive value for the need of CIC at the age of one year followed
probably by lifelong CIC Despite this the presence of an open SD per se has stronger predictive value and each child needs to
be evaluated individually while considering a number of factors The main value of VOP may be as a structured non invasive
screening method to uncover neurogenic bladder sphincter dysfunction in the newborn Studies with a larger number of
subjects than the present are needed to evaluate the potential of VOP in newborns with closed spinal dysraphism in whom
the neurological consequences vary A retrospective analysis detected renal damage on DMSA scintigraphy in 5 of 41 children
with SD who were followed according to a proactive national program with minimal use of surgery Median follow up time
was 10 years High baseline pressure was confirmed as a risk factor for renal damage Compliance with treatment and follow
up is likely to be an important factor for renal health Therefore efforts to support children and their families are crucial A
questionnaire based study of 107 children with SD age 6-16y in Sweden and Norway examined aspects of treatment for
neurogenic bowel dysfunction focusing on incontinence independence general satisfaction and quality of life It was found
that transanal irrigation TAI and antegrade colonic enemas ACE are effective treatments but are time consuming and difficult
to perform independently The majority of children using TAI 72% and ACE 63% never went to the toilet alone to empty their

bowels As children achieving independence on the toilet reported higher quality of life efforts to support independence are beneficial Continent self managing children with healthy kidneys enjoy high quality of life and contribute more fully to society Therefore further research is required to investigate and develop existing and new technologies and methods that mitigate the problems related to SD and to make them accessible to all children with spinal dysraphism Under de senaste 50 åren har det skett en enastående utveckling av mjäligheterna för barn som föds med ryggmärgsbräck Tidigare har majoriteten av barn med ryggmärgsbräck avlidit redan som spädbarn men idag överlever de flesta till vuxen ålder Utan aktiva insatser och uppföljning är dock risken för medicinska problem och allvarlig påverkan på livet mycket stor Nu när nästan alla barn överlever ligger fokus på att också öka livskvalitet och självständighet för personer med ryggmärgsbräck Nästan alla med ryggmärgsbräck måste hantera en allvarlig påverkan på blås och tarmen med risk för njurskador inkontinens och förstoppning I avhandlingens tvärförsta studier valde vi en metod att med minimalt obehag för barnet bedöma blåsfunktionen Detta för att kunna skilja ut de barn som behöver genomgå mer avancerade undersökningar och hjälpa med blåsbehandlingen genom att ta tappningar med kateter så kallad intermittent kateterisering RIK När vi jämförde resultatet av testet för 50 nyfödda med ryggmärgsbräck med samma undersökning av 50 friska nyfödda fann vi stora skillnader Mest tydligt var att de flesta nyfödda med ryggmärgsbräck 69% men inga friska nyfödda läckte urin när man tryckte på blåsan Av nyfödda med ryggmärgsbräck kissade de flesta 74% inte med ströle vilket alla friska nyfödda gjorde Att inte kissa med ströle talade också starkt för att barnet skulle komma att behöva hjälp med RIK för att tömma blåsan vid ett års ålder och sannolikt livet ut Sammantaget visade avhandlingens tvärförsta arbeten att den metod för bedömning av blåsfunktion vi undersökt kan användas för att styra uppföljning och behandling av nyfödda med ryggmärgsbräck Avhandlingens tredje studie visade att aktiv uppföljning av barnen enligt ett nationellt tvärförsta program lyckades förhindra njurskador hos de flesta men att höga tryck i urinblåsan och återkommande urinvägsinfektioner ökade risken för skador i familjernas framtida att i en pressad vardag klara av att genomföra de ofta krävande behandlingar och undersökningar som rekommenderas verkade vara viktig för att förhindra njurskador Stöttning av familjerna är därför viktig Avhandlingens fjärde arbete berörde tarmen som nästan alltid påverkad vid ryggmärgsbräck med risk för svår förstoppning och avföringsläckage Detta har påtaglig påverkan på barnen och deras familjer En tredjedel av de 107 familjerna i tvärförsta undersökningen i Sverige och Norge barn 6-16 år beskrev att man fött avstannade aktiviteter såsom resor på grund av barnets tarmproblem och de barn som hade avföringsläckage rapporterade tydligt lägre livskvalitet än andra Trots denna allvarliga påverkan finns det hittills inga studier som jämför de olika behandlingar som barnet kan använda I tvärförsta kartlade vi därför vilka metoder som användes och hur bra de fungerade Vi ställde frågan till både barn och föräldrar särskilt om avföringsläckage hur länge man var med metoden barnens livskvalitet och självständighet på toaletten Det var utifrån svaren tydligt att både de vanligaste typerna av tarmsköljning var effektiva men tidskrävande och svåra för barn och ungdomar att klara att utföra på egen hand Ingen metod visade sig överlupen den andra men de barn som klarade att sköta tarmtomningen själv skattade sin livskvalitet klart högre än övriga Vi

MRI-Negative Epilepsy Elson L. So,Philippe Ryvlin,2015-03-26 Drug resistant epilepsy with negative MRI is frequently seen in patients considered for epilepsy surgery however clinical evaluation and surgical treatment is very

complex and challenging Advanced imaging techniques are needed to detect the location of the epileptogenic zone In most cases intracranial EEG recording is required to delineate the region of seizure onset this carries some risks of major complications Moreover the borders between the recorded seizure onset and the location of important brain functions are often indistinct in MRI negative epilepsy Overall the outcome of MRI negative surgery is less favorable than that of MRI positive surgery but it can significantly improve with optimal management Each chapter critically appraises the role and value of specific diagnostic and treatment techniques to address the challenges of MRI negative epilepsy surgery Authors critique evidence and share their expertise on the diagnostic options and surgical approaches that make epilepsy surgery possible and worthwhile in patients with this condition
