

Example format for a technical report on WQM

TITLE

The title should clearly and briefly indicate what the report is about.

Executive Summary

Summarises the report in plain English. The Executive Summary should be able to be read and understood independently of the main body of the report. It is often easiest to write after completing the rest of the report.

1: Introduction

Background to the report, including discussion of previous studies in the area or related studies. The introduction should also clearly outline the reason for the study/report, including objectives and any working hypotheses.

2: Methodology

2.1. Experimental/sampling design

A description of the study area and study design, including detail such as equipment used in field and laboratory work, methodology for selecting sampling sites, field work undertaken and methods of laboratory analysis. For a WQM program this detail needs to include what parameters were tested and any standards and protocols used in the laboratory analysis of samples.

2.2. Data analysis

An outline of how the data obtained from sampling and laboratory analysis were analysed, including details of any statistical tests undertaken and their assumptions and limitations.

3: Results

A description of the results obtained without any explanation or interpretation of them. Visual aids such as graphs, tables and maps may be used to summarise the results. If raw data is to be included in the report, it should be placed in an appendix rather than in the results section.

4: Discussion

The results of the study are interpreted and implications of these results in terms of the project objectives are discussed. A discussion of how the results relate to other studies is also common. An evaluation of the methodology used may also be undertaken.

5: Conclusions

Summarises specific conclusions drawn from the results in terms of the project objectives and working hypotheses.

6: Recommendations

Model-Based Engineering of Embedded Real-Time Systems Holger Giese, Gabor Karsai, Edward A. Lee, Bernhard Rumpe, Bernhard Schätz, 2010-10-09 The topic of Model Based Engineering of Real Time Embedded Systems brings together a challenging problem domain real time embedded systems and a solution domain model based engineering. It is also at the forefront of integrated software and systems engineering as software in this problem domain is an essential tool for system implementation and integration. Today real time embedded software plays a crucial role in most advanced technical systems such as airplanes, mobile phones, and cars, and has become the main driver and catalyst for innovation. Development, evolution, verification, conformance, and maintenance of embedded and distributed software nowadays are often serious challenges as drastic increases in complexity can be observed in practice. Model based engineering in general and model based software development in particular advocates the notion of using models throughout the development and life cycle of an engineered system. Model based software engineering reinforces this notion by promoting models not only as the tool of abstraction but also as the tool for verification, implementation, testing, and maintenance. The application of such model based engineering techniques to embedded real time systems appears to be a good candidate to tackle some of the problems arising in the problem domain.

Formal Techniques for Networked and Distributed Systems - FORTE 2002 Doron A. Peled, Moshe Y. Vardi, 2003-06-30 The IFIP TC6 WG 6.1 Joint International Conference on Formal Techniques for Networked and Distributed Systems FORTE 2002 was held this year at Rice University, Houston, Texas, on November 11-14. This annual conference provides a forum for researchers and practitioners from universities and industry to meet and advance technologies in areas of specification, testing, and verification of distributed systems and communication protocols. The main topics are FDT based system and protocol engineering, Semantical foundations, Extensions of FDTs, Formal approaches to concurrent distributed object oriented systems, Real time and probability aspects, Performance modeling and analysis, Quality of service modeling and analysis, Verification and validation, Relations between informal and formal specification, FDT based protocol implementation, Software tools and support environments, FDT application to distributed systems, Protocol testing including conformance testing, interoperability testing and performance testing, Test generation, selection and coverage, Practical experience and case studies, Corporate strategic and financial consequences of using formal methods. A total of 61 papers were submitted to FORTE 2002 and reviewed by members of the program committee and additional reviewers. The program committee selected 22 regular papers, two tool papers, and two posters for presentation at the conference. The program also included three tutorials and five invited talks.

Process Based Unification for Multi-model Software Process Improvement Z.D. Kelemen, 2013-01-30 Many different quality approaches are available in the software industry Some of the approaches such as ISO 9001 are not software specific i.e. they define general requirements for an organization and they can be used at any company Others such as Automotive SPICE have been derived from a software specific approach and can be used for improving specific in this case automotive processes Some are created to improve development processes e.g. CMMI for Development others focus on services e.g. CMMI for Services and again others are related to particular processes such as software testing e.g. TMMi or resource management e.g. People CMM A number of differences among quality approaches exist and there can be various situations in which the usage of multiple approaches is required e.g. to strengthen a particular process with multiple quality approaches or to reach certification of the compliance to a number of standards First of all it has to be decided which approaches have potential for the organization In many cases one approach does not contain enough information for process implementation Consequently the organization may need to use several

approaches and the decision has to be made how the chosen approaches can be used simultaneously This area is called Multi model Software Process Improvement MSPI The simultaneous usage of multiple quality approaches is called the multi model problem In this dissertation we propose a solution for the multi model problem which we call the Process Based Unification PBU framework The PBU framework consists of the PBU concept a PBU process and the PBU result We call PBU concept the mapping of quality approaches to a unified process The PBU concept is operationalized by a PBU process The PBU result includes the resulting unified process and the mapping of quality approaches to the unified process Accordingly we addressed the following research question Does the PBU framework provide a solution

Secure Systems Development with UML Jan Jürjens,2005-11-18 Attacks against computer systems can cause considerable economic or physical damage High quality development of security critical systems is difficult mainly because of the conflict between development costs and verifiable correctness Jürjens presents the UML extension UMLsec for secure systems development It uses the standard UML extension mechanisms and can be employed to evaluate UML specifications for vulnerabilities using a formal semantics of a simplified fragment of UML Established rules of security engineering can be encapsulated and hence made available even to developers who are not specialists in security As one example Jürjens uncovers a flaw in the Common Electronic Purse Specification and proposes and verifies a correction With a clear separation between the general description of his approach and its mathematical foundations the book is ideally suited both for researchers and graduate students in UML or formal methods and security and for advanced professionals writing critical applications

XIII Mediterranean Conference on Medical and Biological Engineering and Computing 2013 Laura M. Roa Romero,2013-10-01 The general

theme of MEDICON 2013 is Research and Development of Technology for Sustainable Healthcare This decade is being characterized by the appearance and use of emergent technologies under development This situation has produced a tremendous impact on Medicine and Biology from which it is expected an unparalleled evolution in these disciplines towards novel concept and practices The consequence will be a significant improvement in health care and well fare i e the shift from a reactive medicine to a preventive medicine This shift implies that the citizen will play an important role in the healthcare delivery process what requires a comprehensive and personalized assistance In this context society will meet emerging media incorporated to all objects capable of providing a seamless adaptive anticipatory unobtrusive and pervasive assistance The challenge will be to remove current barriers related to the lack of knowledge required to produce new opportunities for all the society while new paradigms are created for this inclusive society to be socially and economically sustainable and respectful with the environment In this way these proceedings focus on the convergence of biomedical engineering topics ranging from formalized theory through experimental science and technological development to practical clinical applications

Advances in Modeling Agricultural Systems Petraq Papajorgji, Panos M. Pardalos, 2009-02-28 Agriculture has experienced a dramatic change during the past decades The change has been structural and technological Structural changes can be seen in the size of current farms not long ago agricultural production was organized around small farms whereas nowadays the agricultural landscape is dominated by large farms Large farms have better means of applying new technologies and therefore technological advances have been a driving force in changing the farming structure New technologies continue to emerge and their mastery and use in requires that farmers gather more information and make more complex technological choices In particular the advent of the Internet has opened vast opportunities for communication and business opportunities within the agricultural community But at the same time it has created another class of complex issues that need to be addressed sooner rather than later Farmers and agricultural researchers are faced with an overwhelming amount of information they need to analyze and synthesize to successfully manage all the facets of agricultural production This daunting challenge requires new and complex approaches to farm management A new type of agricultural management system requires active cooperation among multidisciplinary and multi institutional teams and refining of existing and creation of new analytical theories with potential use in agriculture Therefore new management agricultural systems must combine the newest achievements in many scientific domains such as agronomy economics mathematics and computer science to name a few

Patterns and Visualisation and Measurements **Agent-Oriented Software Engineering III** Fausto Giunchiglia, James Odell, Gerhard Weiß, 2003-07-01 Over the past three decades software engineers have derived a progressively better understanding of the characteristics of complexity in software It is now widely recognised that interaction is probably the most important single characteristic of complex software Software architectures that contain many dynamically interacting components each with their own thread of control and engaging in complex coordination protocols are typically orders of magnitude more complex to correctly and efficiently engineer than those that simply compute a function of some input through a single thread of control Unfortunately it turns out that many if not most real world applications have precisely these characteristics As a consequence a major research topic in computer science over at least the past two decades has been the development of tools and techniques to model understand and implement systems in which interaction is the norm Indeed many researchers now believe that in future computation itself will be understood as chiefly a process of interaction

Software Engineering Approaches for Offshore and Outsourced Development Olly Gotel, Mathai Joseph, Bertrand Meyer, 2009-07-01

SEAFOOD 2009 Enabling Global Partnerships to Deliver on Business Needs Companies have been outsourcing areas of software development work for many years either because of the engineering challenges or because the outsourced aspect is not central to their core business A profound transformation has been affecting this model over recent years a massive transfer of development activities from the USA and Europe to a skilled labor force in service providing countries This transformation has been driven by the demands of a global business climate seeking to increase the value delivery of IT investment However the ability to realize this value can prove problematic in practice Of particular concern are the hidden costs of globally distributed models of working such as understanding and communicating the true business needs across organizational and cultural boundaries To address such issues offshore outsourcing requires different support from in house development and this means adapting familiar techniques processes and tools to this setting as well as perhaps creating innovative new ones Coupled with this industry transformation there is hence a pressing need to re-examine these software engineering approaches that either facilitate or impede this model of working With an inevitable focus on the economy in 2009 business decisions regarding the sourcing of software development projects will come under close scrutiny It will become increasingly critical to design global partnerships that both clarify cost benefits and enable delivery on business needs
