creations

Weathering and erosion are natural processes that work together to change Earth's surface. Weathering is the process that breaks down rocks over a long period of time. Water, heat, wind, and plants can all break down rocks into smaller pieces. The rush of a river, over time, can carve away rock along its path. Rainwater that seeps into a crack in a rock may freeze and crack the rock apart. Cold and warm temperatures can make rocks expand and shrink making them break over time. Glaciers and landslides can break rock as they slide down mountains. Wind can blow sand and pebbles that chip away at mountains. Plant roots or small plants can grow in small spaces in rocks. As

Wind chips away a rock (weathering) blows it away (erosion)

Gravity moves the glacier down the mountain breaking rock (weathering) and moving it away (erosion)

The rushing water breaks small rocks and carries them away
