## Principles of Heredity

Gregor Mendel was a scientist and monk who lived in the 1800s and is known as the “father of genetics.” He made important discoveries about how traits, like eye color or height, are passed from parents to their children. Mendel did experiments with pea plants in a garden at his monastery. He carefully studied how traits such as flower color and plant height were inherited through generations. By planting and observing thousands of pea plants, he noticed patterns in how these traits appeared, which helped him figure out the basic rules of heredity.

Mendel discovered that traits are passed down through tiny units called genes (though he didn’t know that word at the time). He learned that each trait is controlled by two “factors,” now known as alleles—one from each parent. These alleles can be dominant (stronger and more likely to show up) or recessive (weaker and hidden unless both alleles are recessive). For example, if a tall pea plant (dominant trait) is crossed with a short one (recessive trait), the first generation might all be tall, but in the next generation, some short plants could appear again. Mendel’s work helped us understand why children can look like their parents, grandparents, or even relatives from generations before.

**Population Genetics:** Donald P. Doolittle, 2012-12-06 I have for a number of years taught a course in population genetics for students interested in plant and animal breeding The objective of the course has been to lay a foundation in population genetics for the concepts of quantitative genetics which are introduced in the last third of the course I have not been able to find an appropriate text for this purpose For a quarter of a century Falconer's Introduction to Quantitative Genetics has been the standard and excellent text in that subject For my purposes however this text is not sufficiently detailed in the population genetics basis for quantitative theory A number of good texts in population genetics are available of which Li's First Course in Population Genetics is didactically the best But these texts are directed toward the genetics of natural populations rather than domestic populations breeding under human control They also tend to treat quantitative genetics gingerly if at all I have therefore developed the present text from my teaching notes The chapters of this book are labeled Lectures Each is intended to correspond approximately to the amount of material which can be covered in a 50 minute lecture Divisions are of course dictated by the natural divisions of the subject matter and the lectures are therefore not of uniform length Nevertheless in so far as possible an attempt has been made to make the average length a lecture's worth
