

Photosynthesis & Respiration

Photosynthesis

Photosynthesis is a process by which green plants and certain bacteria use the energy from the Sun to convert carbon dioxide and water into the simple sugar glucose ($C_6H_{12}O_6$) and oxygen. Plants and animals use glucose as a source of energy for all life processes.

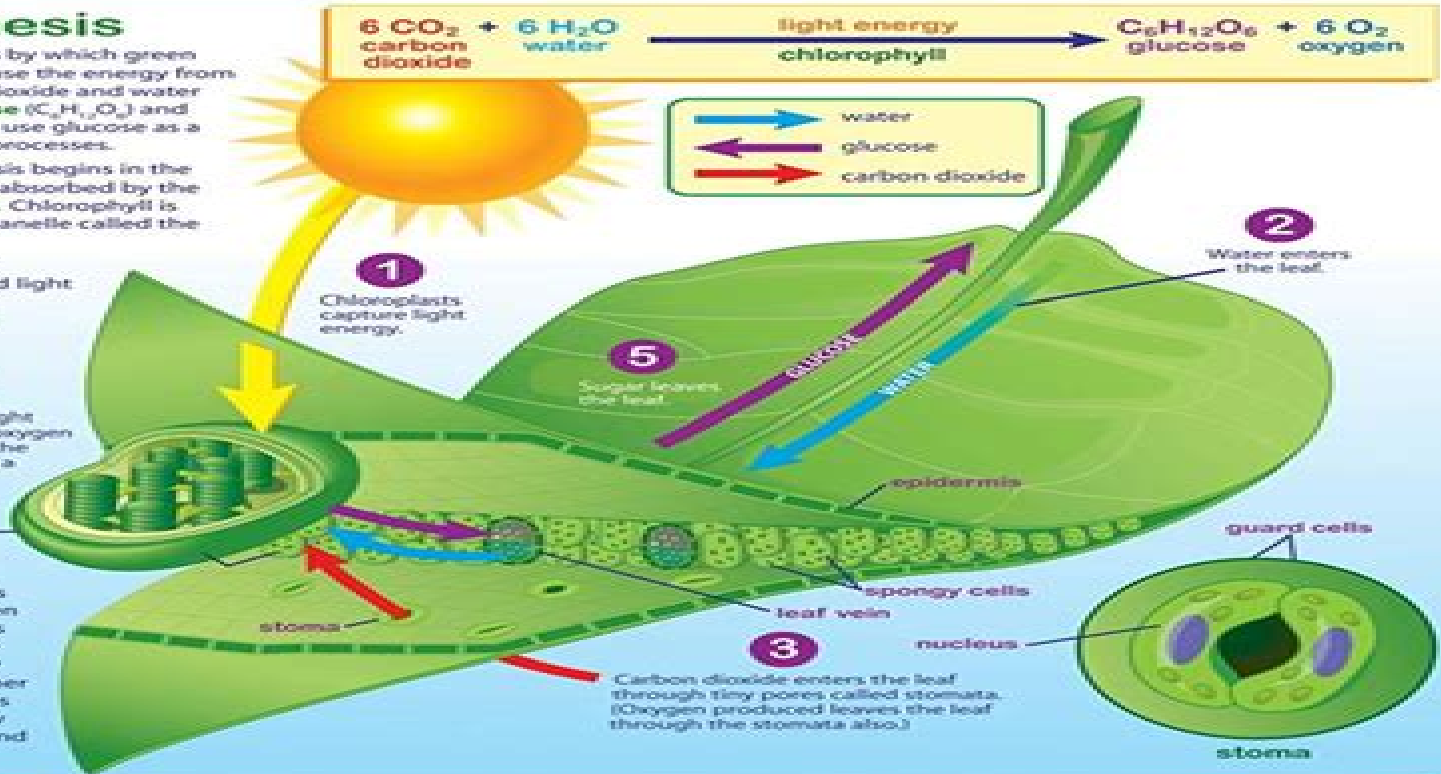

The process of photosynthesis begins in the leaves where light energy is absorbed by the green pigment **chlorophyll**. Chlorophyll is found within a plant cell organelle called the **chloroplast**.

During the second stage of photosynthesis, the captured light energy is used to convert carbon dioxide and water into glucose and oxygen.

Using the captured light energy, glucose and oxygen are produced inside the chloroplasts through a complex series of chemical reactions.

Leaves

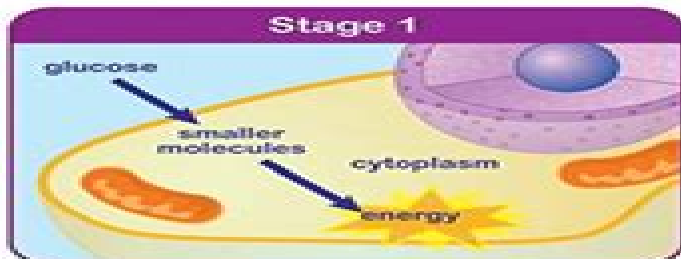

A leaf is made of many layers that are sandwiched between two layers of tough skin cells called the **epidermis**. These layers provide protection for the leaf from insects and other pests. Leaves have tiny pores called **stomata** which allow water and gases to pass in and out of the plant.

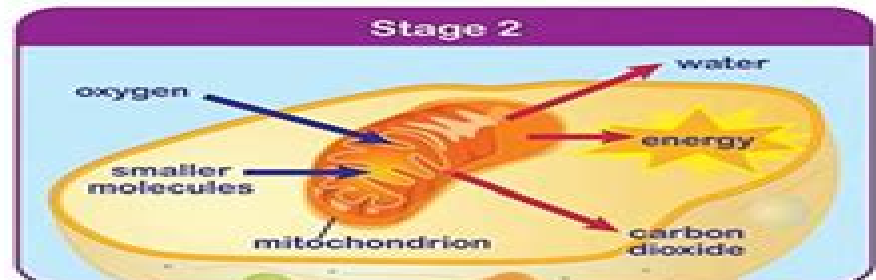

Cellular Respiration

Cellular Respiration is a process by which cells break down glucose to release stored energy.

Stage 1 of respiration begins in the cell's cytoplasm by the break-down of glucose into smaller molecules releasing a small amount of energy.

During **Stage 2**, the smaller molecules combine with oxygen in the mitochondria to produce a large amount of energy along with carbon dioxide and water.

Science for a Green New Deal Eric A. Davidson, 2022-07-26 Science not politics can take us beyond the hype and headlines to forge a realistic green new deal Since it was first proposed in the US House of Representatives the Green New Deal has been hotly debated often using partisan characterizations that critique it as extreme or socialist The intent was not simply to fight climate change or address a specific environmental concern but rather to tackle how climate change and other environmental challenges affect the economy the vulnerable and social justice and vice versa In Science for a Green New Deal Eric Davidson dissects this legislative resolution He also shows how green new deal thinking offers a framework for a much needed convergence of the natural sciences social science economics and community engagement to develop holistic policy solutions to the most pressing issues of our day Davidson weaves the case for linkages among multiple global crises including a pandemic that has reversed progress on fighting poverty and hunger an acceleration of climate change that has exacerbated storms floods droughts and fires and a renewed awareness of profound social injustices highlighted by the Black Lives Matter movement Illustrating these points with his personal life experiences as a child growing up in Montana and as a famed researcher leading a large scientific society Davidson relates these complex challenges to our everyday lives and decision making How he asks can we extract from the Earth's resources what we need for the prosperity well being and dignity of current and future generations of billions of people without exhausting or polluting those resources Written in clear jargon free prose Science for a Green New Deal is a realistic and optimistic look at how we can attain a more sustainable prosperous and just future
