Review of Consistent Deformation and Slope Deflection Methods

The consistent deformation and slope deflection methods are the basis for the development of flexibility and stiffness matrix methods. These methods are taught in basic courses on structural analysis and the author has covered them in detail in his books on Structural Analysis – I and II. A brief review of these methods are presented in this chapter.

2.1 CONSISTENT DEFORMATION METHOD

In this method of analysis, excess restraints on the structure are removed to get **basic determinate structure**. Such structure is also known as **released structure**. The released structure is analysed for given loading to get displacements in the direction of released restraint. Then redundant forces which are unknown are applied in the direction of restraints removed and the displacements in each direction of restraint removed, are obtained separately for each redundant force. These displacements are in terms of redundant forces. Then considering all these displacements of released structure total displacement due to loading and due to redundant forces in each restraint removed is found. Considering the displacement compatibility of original structure equations are assembled. These conditions result into as many equations as there are number of redundant forces. Solution of these simultaneous equations gives the values of redundant forces. Knowing these values moments and forces at any point in the structure can be found. The method is illustrated below by solving few typical cases:

Example 2.1: A propped cantilever of span L is fixed at A and is on roller at B . Analyse it when it is subjected to a concentrated load P at midspan. Assume uniform cross-section throughout.

Solution: Total number of reactions = $3 + 1 = 4$

Number of equilibrium equations available = 3,

$\therefore$ Degree of static indeterminacy = $4 - 3 = 1$.

By releasing support B restraint to vertical deflection is removed and we get a cantilever as basic determinate structure. This released structure is analysed for the given load and the redundant force R_B to get vertical displacements at B . Figure 2.1(a) shows the original structure whereas Fig. 2.1(b) and (c) show released structure subjected to given loads and redundant force respectively.
