## Student Exploration: Human Evolution - Skull Analysis

**Vocabulary:** bipedal, canine, cranial capacity, cranium, evolve, foramen magnum, hominid, hominin, index, maxilla, orbit, palate, skull

**Prior Knowledge Questions** (Do these BEFORE using the Gizmo.)

1. Label one of the **skulls** below as human and the other as a chimpanzee skull.

Human

Chimpanzee

2. What features did you use to identify which skull was human and which was chimpanzee?

The features I used to identify which skull was human was the size of the jaw, and how much it protruded, as well as the size of the brain, and the size and shape of the teeth.

### Gizmo Warm-up

In 1924, a fossilized skull that looked very similar to a chimp skull was discovered. But the skull most definitely did not belong to a chimp. The location of the **foramen magnum**—a hole in the skull where the spinal cord exits—indicated that the individual was **bipedal**, or walked on two legs. This fossil was some of the earliest evidence of human evolution.

Using the *Human Evolution – Skull Analysis* Gizmo, you will discover some of the ways that skulls can be used to learn about human evolution. Start by comparing two modern **hominids**: a human and a chimpanzee.

1. Examine the **Front view** of the *Homo sapiens* (modern human) skull. Then, use the **Select skull** menu to examine the same view of the *Pan troglodytes* (chimp) skull.

How do the skulls compare? The skull of Homo-Sapiens has a much larger skull than the chimpanzee. The chimp has a much larger and wider jaw with much larger canine teeth while the human has small teeth with a small jaw. The chimps skull is much smaller and is not as wide as the Homo Sapiens.

2. Now, examine the **Bottom view** of the two skulls. How do they compare? When it is turned to the bottom view, the skull of the human is much different from the skull of the chimp. The chimps has much bigger and longer teeth than the human. The chimp also has a very large jaw compared to the jaw of the human.
