Question: What determines how large a population can grow?

1. **Think about it:** A **limiting factor** is any factor that controls the growth of a population. What do you think are some of the limiting factors for the rabbit population?

The amount of food available and the rabbits' predators.

2. **Run Gizmo:** Select the **DESCRIPTION** tab. Set the **Simulation speed** to **Fast**. Select the **GRAPH** tab. Click **Play**, and allow the simulation to run for at least 10 years. (Note: You can use the zoom controls on the right to see the whole graph.)

- A. Describe how the rabbit population changed over the course of 10 years.

The population steadily grew for over half of the 10 years but then began to decline at a constant rate.

- B. What pattern did you see repeated every year?

In the spring, the population grew exponentially before declining in winter.

- C. How could you explain this pattern?

Food becomes scarcer for rabbits in winter so their population declines.

3. **Analyze:** The **carrying capacity** is the maximum number of individuals of a particular species that an environment can support. All environments have carrying capacities.

- A. What is this environment's approximate carrying capacity for rabbits? (Note: Average the summer and winter carrying capacities.)

The total average is 384 with 426 during the summer and 342 during the winter.

- B. When did the rabbit population reach carrying capacity? Explain how you know.

The rabbit population hit carrying capacity during the summer and spring months, because the population stopped rising and stayed constant.
