Student Exploration: Drug Dosage

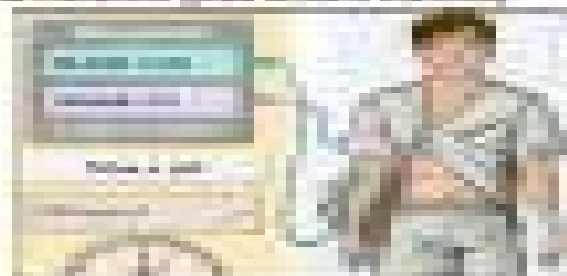

Essential Question: How does drug dosage affect drug concentration in the body?

Prior Knowledge Questions (Do these BEFORE starting the Gizmo.)

Suppose you take aspirin for a headache. What happens when you swallow the pill? How does the aspirin in the pill reach the headache you feel, and the headache goes away? **What happens?**

Aspirin is a substance that causes changes in how your body functions. When you swallow a pill, the pill dissolves in your digestive system and the drug is absorbed into your bloodstream, where it can act on different cells throughout **your body**.

The **Drug Dosage Gizmo** shows you how much drug concentration stays in the bloodstream over time. You can change the amount of drug you take. Although, it's important that you take the right amount. For a full understanding, consult the **Help** button.

1. Click **Pause** (⏸) after about 10 minutes of simulated time in the **Drug Dosage** panel. Observe the concentration graph of the blood. The initial concentration of the drug is zero (minutes 0 minutes).
 - How long does it take for the drug to reach its maximum?
2. Change the dosage to 200 mg and click **Play**. Click **Pause** when the 200 mg value is reached. How long does it take for the drug to reach the blood? Approximately 10 minutes.
3. Click **Play**, and then click **Drop** after the drug reaches its value approximately 10 minutes. What is the initial concentration of the drug? Approximately 100 mg is reached.
