

Study Guide for Chapter 10: Endocrine System

1. Describe the functions of the endocrine system and define hormones. There are three main functions of the endocrine system and those are making hormones for mood, development and growth. Sends hormones into your bloodstream and also regulates the release of hormones. The main functions of hormones are the body's chemical messengers, sending signals into the bloodstream and tissues.

2. Distinguish between exocrine glands and endocrine glands. The exocrine glands secrete substances into a ductal system to an epithelial surface. The endocrine glands secrete products straight to the bloodstream.

3. List and identify the major endocrine glands of the body. The major endocrine glands are the pituitary, the thyroid, parathyroid, thymus, and adrenal glands.

4. Discuss the functions of the major hormones. Determine the endocrine gland that produces each hormone, indicate the target cells or organs of the hormone, and describe their effects. The adrenal glands secrete corticosteroid which controls major functions in the body. The pituitary gland secretes antidiuretic hormone which affects water retention in kidneys. Parathyroid gland secretes (PTH) which regulates blood calcium levels. The thyroid gland secretes (TH) which controls your metabolism. And the thymus gland secretes humoral factors which helps to develop lymphoid systems.
