Pain and Pain-Related Neuropsychiatric Disorders: From Mechanistic Insights to Innovative Therapeutic Strategies
Álvaro Llorente-Berzal, Francesca Guida, Fabio Turco, Rosmara Infantino, 2025-04-07 Chronic pain is an important personal and socio economic burden affecting more than 30% of people worldwide It is highly disabling and associated with long term affective and cognitive sequelae Despite synergistic advances in basic and clinical research some of the most severe conditions remain poorly managed shifting from nociceptive nature to neuropathic and nociplastic components and major neuropsychiatric complications Therefore the understanding of pathophysiological mechanisms and the discovery of new pharmacological targets and innovative approaches are strongly awaited Important advances in basic research focus on the mechanistic aspect offering no direct implication for novel therapeutic strategies Conversely the use of innovative therapies is not easily considered in clinical practice breaking the process of translation for therapy The primary goal of this Research Topic is to create a synergistic circularity of knowledge merging clinical challenges with the latest pathophysiological findings in the field of pain and related neuropsychiatric disorders with implications for pharmacological innovation In addition with a view to sustainability particular attention will be given to compounds of natural origin from new cannabinoids alkaloids and capsaicinoids to tannins flavonoids and other substances or approaches

Salinity and drought stress in plants: understanding physiological, biochemical and molecular responses, volume II Muhammad Waseem, PingWu Liu, Sunil Kumar Sahu, Umashankar Chandrasekaran, 2025-07-31 This Research Topic is part of the series Salinity and Drought Stress in Plants Understanding Physiological Biochemical and Molecular Responses Drought and salinity are two of the foremost environmental factors which restrict plant growth and yield in several regions of the world especially in arid and semi arid regions Due to global climate change drought and salinity are predicted to become more widespread and eventually result in reduced plant growth and productivity in numerous plant species Exposure of plants to extreme drought or salt stress ceases plant growth while plants exposed to moderate stress generally show a slight change in their growth performance Scientists are facing the challenging task of producing 70% more food to feed an additional 2 3 billion people by 2050 Therefore it is imperative to develop stress resilient crops with better yields under drought and salt stress to meet the food requirements of upcoming generations Drought and salinity have significant inhibitory impacts on cellular redox regulation with remodelled plant architecture Salinity hampers plant growth in two phases the first phase leads to plant growth suppression due to the osmotic effect of ions present in soil solution and the second phase leads to growth inhibition caused by ion toxicity due to the uptake and accumulation of specific ions The first phase of salt stress is very similar to that of drought stress However growth under salinity is restricted primarily by osmotic stress Thus creating drought resistant tolerant species would produce plants well suited to a saline environment As salinity in its first phase of salt stress is much like that of drought stress common responses to salinity and drought stresses are expected This Research Topic explores

both the common and distinct responses of plants under salinity and drought which modify plant growth and adaptation Furthermore it will seek to understand the biochemical physiological and genetic mechanisms which are critical for improving plant tolerance to these environmental stresses In recent years due to the advancement in omics and breeding technologies significant progress has been made in this direction but knowledge gaps still exist The efforts in translating the knowledge gained through basic research should be expedited to achieve the desired outcomes of enhancing crop productivity and ensuring global food and nutritional security To ensure the focus remains on impactful applied research we will not be accepting submissions that are purely descriptive in nature We will include contributions on themes such as Mechanistic insights into plant responses to drought and salinity Understanding of the ROS regulation under salinity and drought stress Tools or resources for engineering drought and salt resistant crops Plant breeding towards stress tolerant crop varieties by developing molecular markers and high throughput approaches The role of signal transduction and signaling cascades in response to drought and salinity The use of multi omics approaches to provide insights into traits defining stress tolerance for crop improvement Physiological molecular and genetic mechanisms underlying adaptation of agronomically important crops to abiotic stresses Functional validation and physiological insights of key genes and proteins involved in stress tolerance Advancement in transcriptomic metabolomic proteomic and genomic integrated breeding approaches for enhancing stress tolerance The introduction of new breeding methods to accelerate the rate of genetic gain for sustainable agriculture while maintaining other core traits
