Seismic Ground Response Analysis Nozomu Yoshida, 2014-11-17 This book presents state of the art information on seismic ground response analysis and is not only very valuable and useful for practitioners but also for researchers The topics covered are related to the stages of analysis 1 Input parameter selection by reviewing the in situ and laboratory tests used to determine dynamic soil properties as well as the methods to compile and model the dynamic soil properties from literature 2 Input ground motion 3 Theoretical background on the equations of motion and methods for solving them 4 The mechanism of damping and how this is modeled in the equations of motions 5 Detailed analysis and discussion of results of selected case studies which provide valuable information on the problem of seismic ground response analysis from both a theoretical and practical point of view Earthquake Geotechnical Engineering Design Michele Maugeri, Claudio Soccodato, 2014-02-03

Pseudo static analysis is still the most used method to assess the stability of geotechnical systems that are exposed to earthquake forces However this method does not provide any information about the deformations and permanent displacements induced by seismic activity Moreover it is questionable to use this approach when geotechnical systems are affected by frequent and rare seismic events Incidentally the peak ground acceleration has increased from 0.2 to 0.3 g in the seventies to the current value of 0.6 to 0.8 g Therefore a shift from the pseudo static approach to performance based analysis is needed Over the past five years considerable progress has been made in Earthquake Geotechnical Engineering Design EGED The most recent advances are presented in this book in 6 parts The evaluation of the site amplification is covered in Part I of the book In Part II the evaluation of the soil foundation stability against natural slope failure and liquefaction is treated In the following 3 Parts of the book the EGED for different geotechnical systems is presented as follows the design of levees and dams including natural slopes in Part III the design of foundations and soil structure interaction analysis in Part IV underground structures in Part V Finally in Part VI new topics like the design of reinforced earth retaining walls and landfills are covered
