this text would have as its primary goal preparing students to be competent consumers of mathematical modeling in their future studies. Such a course would also provide students with an understanding of the modeling process and a facility with much of the standard non trigonometric content of college algebra and precalculus. This book builds successively a series of growth models defined in terms of simple recursive patterns of change corresponding to arithmetic, quadratic, geometric and logistic growth. Students discover and come to understand linear, polynomial, exponential and logarithmic functions in the context of analyzing these models of intrinsically and scientifically interesting phenomena including polar ice extent, antibiotic resistance and viral internet videos. Students gain a deep appreciation for the power and limitations of mathematical modeling in the physical life and social sciences as questions of modeling methodology are carefully and constantly addressed. Realistic examples are used consistently throughout the text and every topic is illustrated with models that are constructed from and compared to real data. The text is extremely attractive and the exposition is extraordinarily clear. The lead author of this text is the recipient of nine MAA awards for expository writing including the Ford Evans P.lya and Allendoerfer awards and the Beckenbach Book prize. Great care has been taken by accomplished expositors to make the book readable by students. Those students will also benefit from more than 1 000 carefully crafted exercises. *Catalog of Copyright Entries. Third Series* Library of Congress. Copyright Office, 1974
