

Homeostasis: 3.1 – Maintaining the Internal Environment

Science Understanding

What is homeostasis?

Homeostasis is the regulation in animals involving internal communication by hormonal and nervous systems to integrate and coordinate the activities of cells, tissues and organ systems to maintain a constant internal environment.

Animal Adaptations Assist with Maintaining Homeostasis:

1. **Structural Adaptations:** are particular physical features which assist in tolerating changes.
Examples:
 - Surface area to volume ration
 - Large flat ears
 - Body covering – fur, feathers, blubber
2. **Physiological Adaptations:** are the myriad of internal processes and mechanisms that detect and respond to changing conditions.
Examples:
 - Vasoconstriction or vasodilation (contracting or dilating capillaries – more/less blood flow)
 - Shivering
 - Sweating
3. **Behavioural Adaptations:** are the particular behaviours or actions that help organisms survive in their environment.
Examples:
 - Basking in the sun/moving into the shade
 - Flatten body to increase surface area
 - Huddling in groups

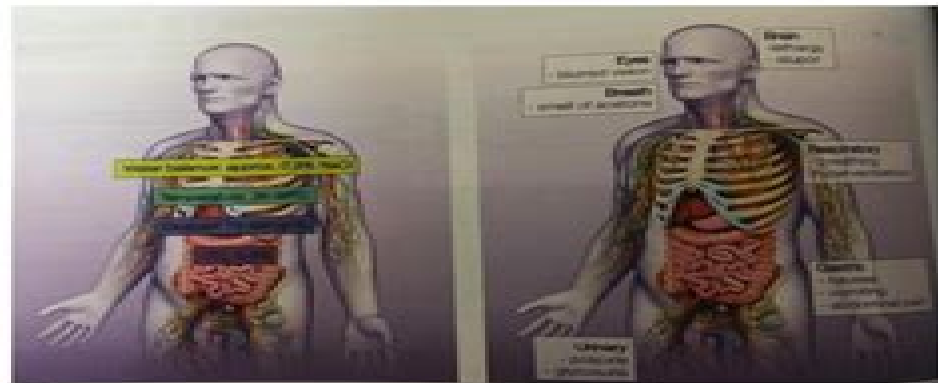

■ **Organisms survive most effectively within their tolerance limits.**

What are tolerance limits?

Tolerance Limits are limits for variables in the internal environment within which the body is able to function normally for such factors as temperature, pH & blood sugar.

■ **Factors for which organisms have tolerance limits include:**

- **Body Temperature:** Is usually maintained between 36°C and 38°C.
 - **Enzymes:** which are responsible for all of the cell's metabolic activity, work best at around 37°C.
 - **Hypertthermia:** occurs if internal temperature rises much above 40°C, causing a life-threatening situation.
 - **Hypothermia:** can also be life-threatening and occurs if there is a drop of a few degrees below 37°C.
- **Water Availability:** Is the water/solute concentration balance in both the extracellular &/or intracellular environment which is another critical factor that needs to be kept within specific tolerance levels.
 - **Shifts away** from the normal levels can lead to swelling or shrivelling of cells as a result of osmosis.
 - A **solute concentration** of about 0.09% NaCl is isotonic with blood plasma.
- **Blood Glucose Level:** is normally around 75-95 mg/dL and sustained deviations from these levels cause serious health issues.
 - **Hyperglycaemia:** (too high blood glucose) is the condition or disease where sufferers are outside the tolerance levels.
 - **Hypoglycaemia:** (too low blood glucose) below the tolerance levels.
