Four Questions on Visual Self-recognition David Butler, 2015-10-19 Whether we like to admit it or not most of us care about our own appearance we spend some of each day in front of mirrors invest our hard earned money on grooming ourselves for both business and pleasure and are increasingly prone to taking selfies The basis of such behaviours is self recognition the process of identifying our own physical appearance Over the last 200 years this seemingly mundane ability has become increasingly subject to investigation by social scientists who are attempting to tease out some of its associated complexities How do we recognize ourselves Does it involve self awareness When does it develop Which species do and do not show self recognition How does the brain perform self recognition What is the evolutionary value if any of self recognition Very few clear cut answers exist for these questions perhaps most problematic is the absence

of consensus about how the brain underlies self recognition This book provides a broad multidisciplinary theoretical framework and an extensive overview concerning these issues which in conjunction with the advocacy and execution of novel experimental paradigms ultimately offers researchers an example of how to further clarify our understanding not only for the neural basis of self recognition but also its development mechanisms and function
