

**Endocrine system.** Endocrine system consists of several glands/glandular cells which bring about the overall common function of chemical coordination in the body. Almost all endocrine glands act in a coordinated manner. They activate each other and work as a system of organs called **endocrine system**. A system is defined as a group of organs performing an overall **common function**.

## 10.2 GENERAL PROPERTIES OF HORMONES

1. Hormones are secreted from their source **directly into the blood** (and not into lymph).
2. They **regulate** the physiological processes by **chemical means**. They affect the enzyme systems of the body.
3. They **act on target organs or cells** usually away from their source.
4. Hormones produced in one species usually show **similar influence in other species**.
5. They are produced in **very small quantities** and are **biologically very active**. For example, adrenaline is active even in a concentration of 1 part in 300,000,000 parts.
6. Chemically, some hormones are **peptides** (proteins such as **insulin**) which are water soluble, some are **amines** (derived from **amino acids** such as **adrenaline**) again water-soluble and some are **steroids** derived from cholesterol such as testosterone which are lipid-soluble.
7. Their **excess** (hypersecretion/oversecretion) or **deficiency** (hyposecretion/undersecretion), both may lead to **serious consequences**.
8. Hormones are **not stored** in the body and are excreted from the system.

*Hormone is a secretion from some glandular part of the body, which is poured into blood and which acts on the target organs or cells of the same individual, bringing about coordination between distant parts of the body.*

    - (ii) Chemical nature .....
    - (iii) Manner of transportation. ....

## 10.3 ENDOCRINE GLANDS

The principal endocrine (hormone-producing) glands in the human body have been shown in Fig. 10.1.

These are enumerated below (only the ones in **bold face** are included in the syllabus):

- |                   |                     |
|-------------------|---------------------|
| 1. <b>Adrenal</b> | 2. <b>Pancreas</b>  |
| 3. <b>Thyroid</b> | 4. <b>Pituitary</b> |
| 5. Parathyroid    | 6. Thymus           |
| 7. Gonads         |                     |

We shall try to explain the major functions of each endocrine gland.

Fig. 10.1 : The principal endocrine glands. (Both sexes have the same endocrine glands except the sex glands i.e. ovaries in female and testes in male). The syllabus specifies only four (the ones in boxes 1-4)
