A P Engineering Neural Tissue from Stem Cells Stephanie Willerth, 2017-07-05 Engineering Neural Tissue from Stem Cells covers the basic knowledge needed to understand the nervous system and how existing cells can be used to create neural tissue. This book presents a broad range of topics related to the design requirements for engineering neural tissue from stem cells. It begins with the anatomy and function of the central and peripheral nervous system, also covering stem cells, their relation to the nervous system, and their function in recovery after injury or disease. In addition, the book explores the role of the extracellular matrix and vasculature, immune system, and biomaterials, including their suitability for neural tissue engineering applications. Provides readers entering the field with a strong basis of neural tissue engineering processes and real world applications. Discusses the most current clinical trials and their importance of treating nervous system disorders. Reviews the structure and immune response of the nervous system, including the brain, spinal cord, and their present cells. Offers a necessary overview of the natural and synthetic biomaterials used to engineer neural tissue. *Central Nervous System Tissue Engineering* Ashley E. Wilkinson, Aleesha M. McCormick, Nic D. Leipzig, 2022-06-01 Combating neural degeneration from injury or disease is extremely difficult in the brain and spinal cord, i.e. central nervous system (CNS). Unlike the peripheral nerves, CNS neurons are bombarded by physical and chemical restrictions that prevent proper healing and restoration of function. The CNS is vital to bodily function, and loss of any part of it can severely and permanently alter a person's quality of life. Tissue engineering could offer much needed solutions to regenerate or replace damaged CNS tissue. This review will discuss current CNS tissue engineering approaches, integrating scaffolds, cells, and stimulation techniques. Hydrogels are commonly used CNS tissue engineering scaffolds to stimulate and enhance regeneration, but fiber meshes and other porous structures show specific utility depending on application. CNS relevant cell sources have focused on implantation of exogenous cells or stimulation of endogenous populations. Somatic cells of the CNS are rarely utilized for tissue engineering, however, glial cells of the peripheral nervous system (PNS) may be used to myelinate and protect spinal cord damage. Pluripotent and multipotent stem cells offer alternative cell sources due to continuing advancements in identification and differentiation of these cells. Finally, physical, chemical, and electrical guidance cues are extremely important to neural cells, serving important roles in development and adulthood. These guidance cues are being integrated into tissue engineering approaches. Of particular interest is the inclusion of cues to guide stem cells to differentiate into CNS cell types, as well as to guide neuron targeting. This review should provide the reader with a broad understanding of CNS tissue engineering challenges and tactics, with the goal of fostering the future development of biologically inspired designs.
