Nutrition des ruminants domestiques, 1995 Measuring Methane Production from Ruminants Harinder P.S. Makkar, Philip E. Vercoe, 2007-09-20 The world's livestock sector is amidst a major transformation fuelled by high demand for meat and milk which is likely to double over the next two decades in developing countries The major driving force behind this demand for livestock products is a combination of population growth urbanization and income growth especially in developing countries The challenge is to enhance animal productivity without adversely affecting the environment A key to this is reducing methane emissions from ruminants The major limitation to ruminant production in many tropical regions of Africa Asia and Latin America where a large proportion of the global ruminant population is located is poor nutrition The productivity of animals is restricted by the low nitrogen and high fibre content of the native grasses and crop residues which form the basis of the diets in these regions Animals on these types of diets emit more methane than animals fed better quality temperate forages These methane emissions represent a loss of digestible energy to the animal up to 15% as well as a threat to the environment Reducing methane production by ruminants could improve their productivity provided the efficiency of ruminal metabolism is not compromised and reduce their contribution to greenhouse gas emissions The challenge is to devise nutritional strategies and identify dietary components particularly from locally available plant resources that reduce methane emissions Impact of Pollution on Animal Products Bernard Faye, Yuriy Sinyavskiy, 2008-04-22 The international advanced research workshop funded by NATO and entitled impact of pollutions on animal and animal products was organized at Almaty Kazakhstan on 27-30 September 2007 Thirty one scientists from 12 countries Kazakhstan Kirgizstan Azerbaijan Ukraine Russia France Great Britain Italy Belgium Romania and Morocco presented conferences at this meeting to share their experience and results The programme included three main aspects i generality on the pollution situation in Central Asia and former Soviet Union republics ii the pollution area and pollution origin in Central Asia and Western countries in relation with animal health and iii the relationships between soil contamination plant contamination and animal products status The present workshop contributed highly to the exchange between scientists giving the opportunity for researchers from Central Asia to access to new scientific approaches and methodologies and for European scientists to assess the extent of the environmental problems in this part of

the world No doubt that these exchanges were the main success of the workshop marked by very stimulating discussions Such meeting was also the opportunity to put on the first stone of a scientific network focused on the subject of the workshop The importance of pollution in Central Asia in general and in Kazakhstan in particular is a well known feature and several references are available on the source and localization of pollution problems in those countries The references are also abundant on the impact of the environmental failures on human health

The Continental-Scale Greenhouse Gas Balance of Europe Han Dolman,Riccardo Valentini,A. Freibauer,2008-06-06 The human interference with the climate system the perturbation of the carbon cycle through massive release of greenhouse gases caused by fossil fuel burning and land use change is threatening society and represents a key challenge for research and policies in the twenty first century Growing evidence of hum induced climate change has raised public concern calling for urgent international policy actions Initiatives culminated in the establishment of the United Nations Framework Convention for Climate Change UNFCCC and the Kyoto Protocol 1997 where Parties for the first time agreed on legally binding commitments to reduce greenhouse gas emissions It is worth noting that the unfinished sink business the Articles in the Kyoto Protocol dealing with terrestrial biospheric carbon dioxide sources and sinks gave carbon cycle research a real boost In the 1990s the regional carbon balance and how the different ecosystems contribute at different timescales under different environmental conditions were hardly known During the fourth Framework Programme 1994 1998 the European Union supported more than 20 research projects studying the components of the carbon cycle These projects provided a solid basis for a more integrated attempt to tackle the research challenges and demands imposed by the Kyoto Protocol at European scale Both the European Commission and the scientific community felt that it was time to develop an integrated carbon cycle research programme taking the new challenges on board
