Radioactive Decay Processes

Non-ionizing radiation is produced in a variety of ways. Infrared light is radiated by everything around us: anything with a temperature glows, just not visibly. Visible light can be produced by heating a solid, such as the heating element in a toaster which glows red. It can also be produced by atomic emission, which is how LED lights work.

If something is hot enough it will even produce ultraviolet light, as the Sun does. X-rays are produced by very violent or energetic astronomical events and by special x-ray vacuum tubes in medical labs. Gamma rays, being strictly nuclear radiation, are only produced by excited atomic nuclei.

Ionizing radiation can also be particles with mass, charge, and a very high speed. Such particles are emitted by unstable atomic nuclei. These nuclei change from an unstable parent nucleus to a more stable daughter nucleus, usually by emitting a particle. For one type of decay it involves absorbing a particle.

Alpha Decay

An americium-241 nucleus emits an alpha particle and becomes a neptunium-237 nucleus.

Positron Decay

A carbon-11 nucleus emits a positron and becomes a boron-11 nucleus.

Beta Decay

A hydrogen-3 (or tritium) nucleus emits an electron and becomes a helium-3 nucleus.

Electron Capture

A beryllium-7 nucleus absorbs an orbiting electron and becomes a lithium-7 nucleus. Nothing is emitted.

Gamma Decay

An excited helium-3 nucleus releases excess potential energy as a gamma-ray photon.

Model 1

Answer the following questions using Model 1.

1. How many protons and neutrons does the americium-241 nucleus have? How many does the neptunium-237 nucleus have?
