Yorke, 2012-12-06 BACKGROUND Sir Isaac Newton brought to the world the idea of modeling the motion of physical systems with equations It was necessary to invent calculus along the way since fundamental equations of motion involve velocities and accelerations of position His greatest single success was his discovery that which are derivatives the motion of the planets and moons of the solar system resulted from a single fundamental source the gravitational attraction of the bodies He demonstrated that the observed motion of the planets could be explained by assuming that there is a gravitational attraction between any two objects a force that is proportional to the product of masses and inversely proportional to the square of the distance between them The circular elliptical and parabolic orbits of astronomy were no longer fundamental determinants of motion but were approximations of laws specified with differential equations His methods are now used in modeling motion and change in all areas of science Subsequent generations of scientists extended the method of using differential equations to describe how physical systems evolve But the method had a limitation While the differential equations were sufficient to determine the behavior in the sense that solutions of the equations did exist it was frequently difficult to figure out what that behavior

would be It was often impossible to write down solutions in relatively simple algebraic expressions using a finite number of terms Series solutions involving infinite sums often would not converge beyond some finite time
