

- 1) **Describe the major categories of drugs used to treat obstructive lung diseases. Bronchodilators**

Beta-adrenergic agonists – activate β_2 -adrenergic receptors in airway smooth muscle and produce functional antagonism of bronchoconstriction in airways of all sizes.

Anticholinergics - produce bronchodilation by directly antagonizing the effects of acetylcholine on the muscarinic receptors in airway smooth muscle.

Theophylline - the mechanism of action remains unclear. Pharmacologic effects include improved diaphragmatic contraction, smooth muscle relaxation, and increased mucociliary clearance.

Leukotriene modifiers - prevent the synthesis or action of cysteinyl leukotrienes, by either blocking at the receptor or blocking the formation of leukotrienes by inhibiting 5-lipoxygenase or the 5-lipoxygenase activating protein.

Anti-inflammatory

Corticosteroids - enter cells, primarily by diffusion, and bind to glucocorticoid receptors (GRs), which are predominantly localized to the cytoplasm of target cells.

(Cromolyn/Nedocromil) - mechanism is not well understood, these agents prevent the release of preformed mediators and arachidonic acid metabolites from a number of cells including mast cells, T-lymphocytes, eosinophils and macrophages.

- 2) **Be able to distinguish the mechanisms of action for beta-adrenergic agonist and anticholinergic bronchodilators.**

Beta-adrenergic agonist - act by activating β_2 -adrenergic receptors, which activate adenylyl cyclase, resulting in an increase in cyclic AMP, activation of protein kinase A, and relaxation of airway smooth muscle through the cyclic AMP/protein kinase A phosphorylation cascade.

Anticholinergic bronchodilators - cholinergic control of airway smooth muscle tone is mediated by nerves that travel in the Vagus. Cholinergic nerves release acetylcholine, which acts on the muscarinic receptors in the airways to produce cholinergic effects. Anticholinergics block only bronchoconstriction mediated through cholinergic nerves, they are not very protective against some stimuli. Although anticholinergic agents have been shown to be effective in patients with COPD, β -agonists are more effective in patients with chronic asthma.

- 3) **Identify the major side effects of beta-agonists and understand how they occur.**

Tremor and palpitations are the most common side effects, tremor results from stimulation of beta-2 adrenergic receptors in skeletal muscle, and palpitations occur primarily from stimulation of beta-2 adrenergic receptors in the peripheral vasculature, resulting in vasodilation with reflex increase in the force and rate of cardiac contraction. They may also produce a number of metabolic side effects, including *hypokalemia* when given in high doses, this occurs because catecholamines stimulate potassium uptake by skeletal muscle.

- 4) **Understand the basic pharmacokinetics of theophylline and be able to describe the major factors that decrease theophylline clearance.** Theophylline is well absorbed from the GI tract. The volume of distribution is relatively constant between individuals at 0.5 L/kg so that 1 mg/kg will raise the serum level 2 mcg/ml.

Theophylline's clearance, however, varies markedly between individuals and also may vary in the same individual over time. Only 10% is eliminated unchanged by the kidney. The major route of clearance is metabolism by the cytochrome microsomal enzyme system in the liver, and therefore, several drugs and related conditions that affect hepatic metabolism may alter its clearance.

Introduction to Clinical Pharmacology - E-Book Marilyn Winterton Edmunds, 2014-03-27 Providing a framework for safe and effective drug administration, Introduction to Clinical Pharmacology, 7th Edition, helps you understand the principles of pharmacology and avoid making medication errors. It promotes safety by showing how drugs and drug classes work rather than asking you to simply memorize information about individual drugs. Safety is also emphasized with a section dedicated to math review and drug dosage calculation. This edition includes updated drug information, new review questions for the NCLEX examination, and a succinct evidence-based approach to pharmacology. Written by nationally known nurse practitioner Marilyn Edmunds, Introduction to Clinical Pharmacology highlights must-know drugs—the ones seen most often in clinical practice. A focus on understanding drug classes rather than memorizing individual drugs helps you understand the actions and uses of drug classes and provides a framework for safe, effective practice as new drugs are introduced and as existing drugs are withdrawn from the market. Coverage of math review and medication administration includes three chapters on math review and drug dosage calculation to promote safe drug administration. Unique 30 must-know drugs, those most commonly prescribed, are highlighted with icons and listed inside the cover for quick reference. Readability and clarity are attained through the use of a simplified vocabulary and shorter sentences, making the content easier than ever to learn. Vivid, full-color design includes 200 drawings and photographs. Do Not Confuse drug list is located on the inside cover for quick reference, helping you avoid drug errors with common look-alike or sound-alike drug names. Consistent chapter format covers each drug class with Action, Uses, Adverse Reactions, Drug and Food Interactions, and Nursing Implications, and Patient Teaching sections. Application of the nursing process to each drug class includes Assessment, Diagnosis, Planning, Implementation, Evaluation, and Patient and Family Teaching. Key content is highlighted as in all of Elsevier's LPN Threads textbooks, with features such as Clinical Goldmines, Clinical Pitfalls, Memory Joggers, Lifespan Considerations, and Complementary and Alternative Therapies boxes. Case studies in all drug chapters offer practice in applying information to realistic clinical situations and help you prepare for the NCLEX-PN Examination. Drug Calculation Review questions reinforce your drug calculation and math skills in the context of clinical practice. Critical thinking questions at the end of each chapter
