

HOW TO SOLVE DRUG CALCULATIONS

- Identify what type of drug calculation you are. First step, your answer needs to estimate a rough answer. In many cases, drawing a picture that visually represents the problem is often a helpful strategy.

- Remember that a formula often used for working out how many tablets to take or how to drug below is often as follows:

$$\text{Volume required} = \frac{\text{Strength required (mg)}}{\text{Stock strength (mg)}} \times \text{Volume of stock}$$

TIP: An easy way to remember this formula is:
Volume reqd
Stock strength

- Remember that a formula often used to work out the number of drops per minute delivered by an intravenous infusion is:

$$\text{Drop rate (dpm)} = \frac{\text{Volume (ml)} \times \text{Drop factor}}{\text{Time (hr)} \times 60}$$

NOTE: Drop factor for drip set volume

- Remember that the intravenous infusion, sometimes you are asked to calculate volume, time, or rate, and the following formulae can be useful.

$$\text{Volume (ml)} = \frac{\text{Rate (ml/hr)} \times \text{Time (hr)}}{1}$$

$$\text{Rate} = \frac{\text{Volume (ml)}}{\text{Time (hr)}}$$

$$\text{Time} = \frac{\text{Volume (ml)}}{\text{Rate (ml/hr)}}$$

- After applying the formula (if relevant), or calculating an exact answer using common sense, go back and check if your final answer shows the same ball-park estimate of what, with, you?

EXAMPLE 1: DRUG MADE UP FROM STOCK SOLUTION

This example illustrates how to work out solutions for orally taken drugs made up from stock solution – for example, working out how many ml to inject when the drug is in a stock solution.

QUESTION: A patient is ordered 750 mg of penicillin. What the volume required if the stock solution contains 100 mg of penicillin per 200ml.

TIP ANSWER: We'll be using this formula:

$$\text{Volume required} = \frac{\text{Strength required (mg)}}{\text{Stock strength (mg)}} \times \text{Volume of stock}$$

- Here above the strength of medication that patient needs and the stock strength.

Strength Required is 750 mg. Stock strength is 100 mg in 200ml.

At this point our rough answer is – Since that's 1 ml, and is 100 less than 200ml.

- Now you need to do the same, convert 750 mg to mg by multiplying by 1000.
 e.g. 750mg = 750 × 1000mg = 750,000mg = 750g

- Now put the values into the above formula.

Now that 750g (what the patient needs) is a very small part of 750,000g = 750kg you need to do to be less than 200ml

$$\text{Volume required} = \frac{750}{750,000} \times \frac{1000}{1} \times \frac{200}{100} = \frac{100}{1000} \times \frac{200}{1} = 20 \text{ ml}$$

ANSWER: Based on the above, your answer is 20ml
