

Quantitative Research Critique

Population and Sample

It was clear from the research paper that the population under study was clearly identified, described and chosen. The number of people used in both the control and the intervention was 25 participants each. The manner in which the sample was chosen and given the intervention was clearly elaborated in the methodology section of the research paper.

The use of a prospective randomized, 2 group-design ensured the researchers minimized sample bias. Both the participants given the intervention and the control were randomized. Randomization minimized bias when giving the intervention to the experimental and control groups. To ensure a representative sample is provided, the researchers randomly selected the participants from the study population.

In most cases, a sample size of more than 30 participants is critical for generating valid and reliable results. The researchers used a sample size of 50 which was appropriate for generating information that could be used for making valid conclusions for the research. However, there was no use of power analysis to estimate sample size. It could be more informative for the researchers to indicate how they came up with the sample size.

Data Collection and Measurement

The health status and selfcare outcomes examined in the research were well operationalized using the randomized control design. The interviews were conducted in a way that allowed the researchers to examine the outcomes of the intervention on the participants and the control group.
