

NUTRITIONAL ANALYSIS

(SAMPLE)

I have analyzed my diet by comparing the intake of both energy-yielding nutrients and micronutrients to the standards recommended for a person of my gender, age, height, and weight. Based on the differences on the specific nutrients I am taking as compared to those recommended, I have concluded that certain changes in my diet would enhance my dietary intake of nutrients in the short run and likely enhance my overall nutritional status in the long run.

I am taking in only 47 percent of the recommended calories for a person of my age, gender, and body size. Calculations indicate my estimated energy needs to be 2029.93 kcalories per day. After averaging my energy intake over the three days, I see that my average is only 944.69 kcalories. While some studies indicate that reducing caloric intake to 80% of energy needs may prolong life, my 47% intake may mean that I am neglecting to take in certain needed nutrients. Also, I need at least 1555.2 kcalories just for my basal metabolism. Since I am only at 60.7% of that figure, it may be that I am unable to keep up with my basal metabolic needs.

My intake of both vitamins and minerals is very low compared to the RDAs and DRIs. Most notably my intake is quite low for the B vitamins, such as thiamin, riboflavin, niacin, vitamin B6, and folate. All of these vitamins are necessary for energy production¹, and some of them are needed in cellular reproduction. With my average daily intake so low, it is likely that, in addition to the reduced intake of kcalories, I am dangerously low in the cofactors needed for energy production. I have felt tired a great deal of the time, and I have had to fight off disease more often than I would think normal. I think, for that reason, that I should increase my intake of those foods high in these nutrients. That would include whole grains, leafy green vegetables, and nuts or seeds.

The minerals that I am getting in quantities less than recommended are calcium, magnesium, potassium, and zinc. Although my sodium is lower than normal, it is not as low as these others. Nonetheless sodium is also at only 57% of recommended amounts. At my age, it is not a good idea for me to take in so little calcium (my average intake is only 54% of RDA), since there is an increased risk of osteoporosis in post-menopausal women. Magnesium is used in over 300 biochemical reactions in the body, and I am taking in only 51% of the RDA. It is also needed for energy production, and my lowered intake could again account for my fatigue and

Nutrition Diet Analysis Paper:

Value chains for nutritious food: Analysis of the egg value chain in the Tigray region of Ethiopia Hirvonen, Kalle, Baye, Kaleab, Headey, Derek D., Hoddinott, John F., 2020-10-07 Eggs have high potential for improving nutrition outcomes in low income countries yet very few children in such settings consume eggs on a regular basis despite widespread poultry ownership To redress this disconnect a number of interventions have been implemented to improve household production of poultry products as well as caregiver awareness of the nutritional benefits of eggs and other animal sourced foods However very few of these interventions have tried to leverage food markets to improve nutrition even though most rural people predominantly rely on markets for the majority of their non staple food consumption This study was implemented to better understand the constraints to purchasing eggs for consumption by young children in rural Ethiopia with a view to informing the design of market oriented interventions that might cost effectively increase children s egg consumption To do so we analyzed secondary datasets on poultry ownership household and child egg consumption and retail egg prices to understand egg markets and the egg value chain in Tigray Similar to other contexts in sub Saharan Africa we find that two thirds of households own poultry though only one quarter of young children consumed eggs in the past 24 hours Although markets in Tigray are well integrated likely because of the important role of egg aggregators egg prices remain high A modest consumption level of 2.5 eggs per person per week would cost around 10 percent of the total budget of households in the poorest quintile of households even though eggs are more affordable than other animal sourced foods We find that egg consumption among young children is not constrained by fasting associated with Orthodox Christianity High prices are likely the main constraint and are a function of low levels of intensification in egg production which is dominated by backyard poultry systems characterized by high mortality rates and low productivity

Food Analysis Theory and Practice was published in 1971 and was revised in 1978 The second edition was published in 1987 and in 1993 we found it necessary to prepare a third edition to reflect and cover the most recent advances in the field of food analysis A complete revision of a book is an arduous and anguished task The following are challenges that we wanted to address in this revision to update the material without eliminating classic and time preserved and honored methods used by the food analyst to broaden and deepen the coverage and scope without increasing the size of the book and to produce a textbook for senior undergraduate and graduate students with regard to objectives scope and outlay while providing a reference and resource for the worker and researcher in the field of food analysis To meet those challenges we added much new material and took out practically the same amount of relatively outdated material Every chapter has been extensively updated and revised many of the pictures in the previous editions were deleted and whenever available and appropriate were replaced by diagrams or flow sheets In Part I we have expanded the sections on sampling preparation of samples reporting results and reliability of analyses
