SECTION A
(READING & OTBA: 20 Marks)

1a

Read the following passage carefully.

5

CHARACTERISTICS OF LASER LIGHT

Laser light has four characteristics that distinguish it from light produced by other sources, eg., an electric bulb, a fluorescent lamp, or the sun. The light from these latter sources travels in all directions. In contrast, laser light is highly directional; in other words, it travels in only one direction. The laser has a variety of uses. For example, industrial lasers cut teeth in saws, drill eyes in surgical needles and guide bulldozers. Surveyors use a laser range finder to measure distances in making maps.

In communications, a laser can transmit voice messages and television signals. The laser has great advantages over electronic transmitters, such as those used to produce radio and TV signals. In scientific research, the scientists are experimenting with laser to separate isotopes of uranium. Lasers can also disclose even after 40 years, the fingerprint left by criminal on previously print-proof materials like leather or human skin.

In military operations some types of bombs and artillery shells are guided to their targets by laser beams. Current military research is attempting to develop high-energy lasers that could destroy enemy aircraft and missiles – the USA's Strategic Defence Initiative (SDI) or 'Star Wars' programme. Satellites bearing such lasers could one day form part of weapon systems in outer space.

On the basis of your reading of the above passage, answer the following questions :

- i) How does laser light travel?
- ii) What are the advantages of using laser over electronic transmitters?
- iii) How are laser beams useful in military operations?
