1. A ping fails when performed from router R1 to directly connected router R2. The network administrator then pings the host on the other side neighbor connected. Why would the network administrator know they connected if the ping failed between the two routers?

- The network administrator would expect to receive a response from the other side and not work.
- **The network administrator would expect to receive a reply to ping R2.**
- The network administrator would expect to receive the IP address configured on router R2.
- The network administrator would expect to not receive a connectivity test for established hosts in the directly connected network.

Explanation:

The other side neighbor connected can be used for pinging from Layer 1 and Layer 2 connectivity across boundaries from Cisco devices. For example, if two routers have adjacent IP addresses, a ping between the devices will fail, but if you pinged an other side neighbor will be successful. The other side neighbors should still be useful in verifying that IP addresses are correctly configured in each the same IP addresses assigned to the two routers.

2. Which statement is true about EGP and a Cisco device?

- The other side neighbor device connected with router R1 of address 10.1.1.1/24 of router R2 is successful.
- To disable EGP globally, the router enables connecting to local neighbor address 10.1.1.1/24.
- **EGP can be disabled globally on a Cisco device.**
- Disabled or not, on the other side router, the EGP protocol is always implemented in routers.

Explanation:

EGP is a Cisco proprietary protocol that can be disabled globally by using the no ip egp command. Configuring the other side neighbor is optional, but it is not required for the other side neighbor.
