Uganda Operational Plan Report Fy 2013 United States Department of State, 2014-11-12 In September 2012 the Ministry of Health MOH released the results of the Uganda AIDS Indicator Survey UAIS 2011 which indicated that Uganda continues to experience a severe HIV epidemic HIV prevalence in the general population 15 to 59 years old is estimated to be 7.3% in 2011 compared to 6.4% in 2004. HIV prevalence is higher among women 8.3% than among men 6.1%. Compared to the 2004 UAIS survey the magnitude of change in HIV prevalence varied across regions Central Western Southwestern and Northern regions remain the worst affected while modest declines in prevalence were recorded in the East Central and Mid Eastern regions Of particular concern is the rise in HIV prevalence among young people aged 15-24 years generally and in all age groups specifically in the West Nile and North East regions that previously were least affected UNAIDS projects the number of new annual infections at 150,000 in 2011 an increase from 120,000 in 2004 AIDS mortality is estimated at 62,000 deaths in 2011 the lowest estimate in a long decline since 2000 reflecting the significant expansion of ART The UNAIDS most recent World AIDS Day Report warned of increasing unprotected sex both sexes and multiple partners women The estimated number of people infected with HIV has risen to 1.39 million 55% of whom are female and 14% are children under the age of 15 years HIV is predominantly heterosexually transmitted accounting for 75-80% of new infections However population subgroups show that the most affected and the risk factors and drivers of HIV infections have evolved in recent years Studies show an HIV prevalence of 1-2% in university students 15-40% in fishing communities 37% among sex workers 18% in the partners of sex workers and 13% in the group of men with a history of having sex with men Strikingly 35% of new infections occur amongst self reported monogamous individuals which raises concerns regarding rising multiple concurrent partnerships The remaining transmissions are largely due to mother to child HIV transmission In response to the 2011 UAIS results PEPFAR revised its programmatic and technical approaches and targets to better respond to Uganda's escalating epidemic The 2013 COP is

based on scientific evidence prioritized proven interventions resources matched effectively across subpopulations and efforts directed towards sources of new infections to assist the HIV AIDS epidemic response in Uganda The 2013 COP is the product of a consultative process that involved the GOU PEPFAR implementing partners IP and bilateral and multilateral donors

Ghana Operational Plan Report Fy 2013 United States United States Department of State, 2014-11-12 HIV prevalence and incidence have been declining in the general population since prevalence peaked at 2.4% in 1998 and is presently estimated at 1.5% in the general population Nevertheless the numbers of persons living with HIV and AIDS continue to increase due to population growth and to the decline in AIDS deaths as more infected persons receive anti retroviral treatment ART HIV infection rates among young pregnant women attending antenatal clinics have been declining as measured by the national HIV sentinel surveillance system HIV prevalence among persons 15-24 years old is estimated to be 1.7% and is expected to decline HIV prevalence in key populations 11% in sex workers and 18% in MSM and in tuberculosis patients 15% continues to be much higher than that of the general population From a modes of transmission study MOT conducted in 2008 it is estimated that sexual transmission accounts for the majority of new adult infections and that almost 40% of new adult infections can be attributed to FSWs their clients and the partners of their clients and MSM Twenty nine percent of new infections are attributed to casual heterosexual sex and the partners of those who engage in casual heterosexual sex It is unclear if informal transactional sex by people who do not consider themselves sex workers e.g university students represents another driver of the epidemic An estimated 9% of all new infections is attributed to MTCT of HIV
