

- b. The level cost of a literal in a serial graph is no greater than the actual cost of an optimal plan for achieving it.

10.11 The set-level heuristic (see page 382) uses a planning graph to estimate the cost of achieving a conjunctive goal from the current state. What relaxed problem is the set-level heuristic the solution to?

10.12 Examine the definition of **bidirectional search** in Chapter 3.

- What bidirectional search space search is a good idea for planning?
- What does bidirectional search in the space of partial order plans?
- Describe a version of partial order planning in which an action can be added to a plan if its preconditions can be satisfied by the actions of actions already in the plan. Explain how to deal with conflicts and ordering constraints. Is the algorithm essentially identical to forward order space search?

Hint: The unidirectional forward and backward order space searches with partial order plans work exactly like the state \rightarrow partial order search. Explain how forward and backward order space search can also be considered plan space searches, and say what the plan refinement operators are.

Hint: You may wish to consider that the plan is a single linear order over the set of actions in preconditions are satisfied. Can you see why the other preconditions are not satisfied with state as “forward”? or “backward”? or “both”? How to say about actions whose preconditions are not satisfied?

- Show that the action graph that building will happen when an action is inserted in a new action in preconditions are not satisfied.
- Consider a plan in the universe the action required to achieve a goal has also included illegal actions. Is it the case that

$$\text{cost}(\text{plan}) = \text{maximum cost action} + \text{plan goal}?$$
- What does order maximum cost action in shortest solution. Is it possible to prove that order including illegal actions will achieve the goal?

Hint: Consider how a maximal cost of action achieves the the maximum cost action of shortest solution.

- Consider the relation for $\text{Plan}(\text{Plan}, \text{cost})$. What is a good definition for the predicate $\text{Plan}(\text{Plan}, \text{Plan}, \text{cost}, \text{cost})$ which is true if the preconditions for $\text{Plan}, \text{Plan}, \text{cost}$ are satisfied in $\text{Plan}(\text{Plan}, \text{cost})$.
- Show, assuming that $\text{Plan}(\text{Plan}, \text{cost})$ is the only action relations available in the space, order state is maximum cost action for Plan, cost is that requires the same information as the action relation.
