**FIGURE 1 Studying Earth's Past** Paleontologists study fossils—remains of life from the distant past—to learn how life forms have changed through time.  
**Pose Questions** What questions do you have about this fossil?

**THE SPECTACULAR ERUPTION** of a volcano, the dramatic scenery of a rocky coast, and the destructive power of a hurricane are all subjects for Earth science. The study of Earth science deals with many fascinating and practical questions about our environment. What forces shape the features of our landscape, from the tallest of mountains to the deepest of valleys? What causes ocean tides? Why does our daily weather change? Is our climate changing? How old is Earth? What is an ice age like? Will there be another?

Understanding Earth is not an easy task because our planet is continually changing. Earth is a dynamic planet with a long and complex history.

## Overview of Earth Science

 **Earth science** is the name for the group of sciences that studies Earth and its neighbors in space. The field of Earth science includes many subdivisions, including geology, oceanography, meteorology, and astronomy.

**Geology** Units 1 through 4 of this textbook focus on the science of **geology**, a word that means “study of Earth.” Geochemistry, geophysics, geobiology, and paleontology are all areas of study within geology.

Geology is divided into two broad areas—historical geology and physical geology. The aim of historical geology is to understand Earth’s long history. Historical geology tries to establish a timeline of the vast number of physical and biological changes that have occurred in the past.

Paleoclimatology Colin P. Summerhayes, 2020-06-22 Life on our planet depends upon having a climate that changes within narrow limits not too hot for the oceans to boil away nor too cold for the planet to freeze over. Over the past billion years Earth's average temperature has stayed close to 14-15°C oscillating between warm greenhouse states and cold icehouse states. We live with variation but a variation with limits. Paleoclimatology is the science of understanding and explaining those variations those limits and the forces that control them. Without that understanding we will not be able to foresee future change accurately as our population grows. Our impact on the planet is now equal to a geological force such that many geologists now see us as living in a new geological era the Anthropocene. Paleoclimatology describes Earth's passage through the greenhouse and icehouse worlds of the past 800 million years including the glaciations of Snowball Earth in a world that was then free of land plants. It describes the operation of the Earth's thermostat which keeps the planet fit for life and its control by interactions between greenhouse gases land plants chemical weathering continental motions volcanic activity orbital change and solar variability. It explains how we arrived at our current understanding of the climate system by reviewing the contributions of scientists since the mid 1700s showing how their ideas were modified as science progressed. And it includes reflections based on the author's involvement in palaeoclimatic research. The book will transform debate and set the agenda for the next generation of thought about future climate change. It will be an invaluable course reference for undergraduate and postgraduate students in geology climatology oceanography and the history of science. A real tour de force. An outstanding summary not only of the science and what needs to be done but also the challenges that are a consequence of psychological and cultural baggage that threatens not only the survival of our own species but the many others we are eliminating as well. Peter Barrett Emeritus Professor of Geology Antarctic Research Centre Victoria University of Wellington New Zealand. What a remarkable and wonderful synthesis it will be a wonderful source of paleoclimate information and insights. Christopher R Scotese Professor Department of Earth and Planetary Sciences
