

Classifying Rocks: **Igneous**, **Sedimentary**, and **Metamorphic**

Rocks are classified into three groups based on their characteristics and how they were formed. There are three main types of rocks:

Igneous rocks are formed when molten rock cools and hardens. They are found at or below Earth's surface.

Sedimentary rocks are formed when layers of sediment get compacted together to form rock. They are formed below Earth's surface.

Metamorphic rocks are formed when a rock is changed by extreme heat and pressure. They are formed deep below Earth's surface.

Read about each mystery rock. Write whether each rock is igneous, metamorphic, or sedimentary. The first one has been done for you.

Rock A formed when layers of sand, mud, and pebbles were pressed together. It contains grains of many different sizes.

sedimentary

Rock B formed when melted rock cooled at Earth's surface. It has both large and small mineral grains.

Rock C formed when layers of ocean sediment were pressed together. It contains fossils of marine animals.

Rock D formed when limestone was changed by high temperature and pressure. It may be used in countertops and flooring in homes.

Rock E formed when another rock was changed by high temperature and pressure. It has bands of dark and light mineral grains.

Rock F formed when melted rock cooled and hardened. The melted rock trapped water and gas bubbles as it cooled, making it very lightweight and porous.
