Pearson/Prentice Hall, Michael J. Padilla, 2004-10 **Density Functional Theory** Daniel Glossman-Mitnik, 2019-01-30 Density Functional Theory or DFT for short is a potent methodology useful for calculating and understanding the molecular and electronic structure of atoms molecules clusters and solids Its use relies not only in the ability to calculate the molecular properties of the species of interest but also provides interesting concepts that allow a better comprehension of the chemical reactivity of the studied systems This book represents an attempt to present examples on the utility of DFT for the understanding of the chemical reactivity through descriptors that constitute the basis of the so called Conceptual DFT sometimes also named as Chemical Reactivity Theory as well as the application of the theory and its related computational procedures in the determination of the molecular properties of different systems of academic and industrial interest

Chemistry in Action: Making Molecular Movies with Ultrafast Electron Diffraction and Data Science Lai Chung Liu, 2020-09-10 The thesis provides the necessary experimental and analytical tools to unambiguously observe the atomically resolved chemical reactions A great challenge of modern science has been to directly observe atomic motions during structural transitions and while this was first achieved through a major advance in electron source brightness the information content was still limited and new methods for image reconstruction using femtosecond electron diffraction methods were needed One particular challenge lay in reconciling the innumerable possible nuclear configurations with the observation of chemical reaction mechanisms that reproducibly give the same kind of chemistry for large classes of molecules The author shows that there is a simple solution that occurs during barrier crossing in which the highly anharmonic potential at that point in nuclear rearrangements couples high and low frequency vibrational modes to give highly localized nuclear motions reducing hundreds of potential degrees of freedom to just a few key modes Specific examples are given in this thesis including two photoinduced phase transitions in an organic system a ring closure reaction and two direct observations of nuclear reorganization driven by spin transitions The emerging field of structural dynamics
