vision is a rather fascinating domain of research. Scientists of various origins like biology, medicine, neurophysiology, engineering, mathematics etc. aim to understand the processes leading to visual perception process and at reproducing such systems. Understanding the environment is most of the time done through visual perception which appears to be one of the most fundamental sensory abilities in humans and therefore a significant amount of research effort has been dedicated towards modelling and reproducing human visual abilities. Mathematical methods play a central role in this endeavour.

Introduction David Marr's theory was a pioneering step towards understanding visual perception. In his view, human vision was based on a complete surface reconstruction of the environment that was then used to address visual subtasks. This approach was proven to be insufficient by neurobiologists and complementary ideas from statistical pattern recognition and artificial intelligence were introduced to better address the visual perception problem. In this framework, visual perception is represented by a set of actions and rules connecting these actions. The emerging concept of active vision consists of a selective visual perception paradigm that is basically equivalent to recovering from the environment the minimal piece of information required to address a particular task of interest.

 C. McGaghie, John J. Frey, 2012-12-06 This book is a bold and useful tool that provides the concepts principles and facts
 needed to build and to strengthen a career in academic medicine Developing a high level of competency in academia
 requires the development of skills in addition to those in one's own specialty or discipline One needs skills for conducting
 research meeting administrative responsibilities and educating students and colleagues These skills are not bells and
 whistles They are the elements of academic life that make the position truly academic This book provides the critical
 information needed to succeed in that world Until now many academicians have learned about elements of their job outside
 their individual discipline by experience and through the observation of role models and mentors In the complex highly
 competitive rapidly changing world of academic medicine there is no longer time for a prolonged apprenticeship The
 institution is endangered when individuals are selected for critical posts based upon skills in areas that may not be central to
 the principal responsibilities of the new position How often one hears He is a great scientist but he runs his department with
 a shoe box mentality She is a fantastic clinician but she runs a committee as if she knows everything I hate working with her
 How can a full professor be such a lousy teacher All of the above are symptoms of the need for special skills *Accessing
 the General Physical Education Curriculum for Students with Sensory Deficits* Roseanna Davidson, Effie Laman, Michael F.
 Shaughnessy, 2006 Students in a regular physical education program typically learn skills through observation and practice
 Teachers and specialists working with students who are sensory impaired with multiple disabilities face unique challenges
 Because such students make up a small percentage of the population physical education texts on adaptation instructional
 strategies and activities for groups give only minimal information about working with them This new book explores the issues
 of the physical education curricula for sensory handicapped children Typically these curricula are based on old techniques
 that have been used since time immemorial Rather than examine how teachers utilize obsolete curricula this important book
 examines how they effect the students Neurological Rehabilitation Darcy Ann Umphred, PT, PhD, FAPTA, Rolando T.
