Subduction and Collision Dynamics of Tectonic Plates Zhong-Hai Li, Jie Liao, Lijun Liu, Manuele Faccenda, 2022-11-07 **Basics of Marine and Estuarine Ecology** Abhijit Mitra, Sufia Zaman, 2016-02-02 The book presents recent research on marine ecology in different parts of the world It aims to shed light on relevant topics for budding marine ecologists The blue soup of Planet Earth which comprises both biotic and abiotic components is essential to keeping the wheel of civilization running Four major ecosystem service categories have been identified within this context namely provisioning services such as water food mangrove timber honey fish wax fuel wood fodder and bioactive compounds from marine and estuarine flora and fauna regulating services such as the regulation of climate coastal erosion coral bleaching and pollution cultural services encompassing recreational tourism spiritual and other non material benefits and supporting services such as nutrient cycling and photosynthesis These valuable services are obtained from various resources that must be conserved for the sake of humanity This book presents data for each resource type not just in the form of a simple description but also through case studies that resulted from several research projects and pilot programs carried out in different parts of the world Statistical tools were also used to critically analyze the

influence of relevant hydrological parameters on the biotic community Advanced research in marine and estuarine ecology is based on the use of sophisticated instruments sampling precision statistical tools etc which have also been highlighted in the book

Supercontinent Cycles Through Earth History Z.X. Li,D.A.D. Evans,J.B. Murphy,2016-05-20 The supercontinent cycle hypothesis attributes planetary scale episodic tectonic events to an intrinsic self organizing mode of mantle convection governed by the buoyancy of continental lithosphere that resists subduction during the closure of old ocean basins and the consequent reorganization of mantle convection cells leading to the opening of new ocean basins Characteristic timescales of the cycle are typically 500 to 700 million years Proposed spatial patterns of cyclicity range from hemispheric introversion to antipodal extroversion to precisely between those end members orthoversion Advances in our understanding can arise from theoretical or numerical modelling primary data acquisition relevant to continental reconstructions and spatiotemporal correlations between plate kinematics geodynamic events and palaeoenvironmental history The palaeogeographic record of supercontinental tectonics on Earth is still under development The contributions in this Special Publication provide snapshots in time of these investigations and indicate that Earth s palaeogeographic record incorporates elements of all three end member spatial patterns
