

Matter is anything that has mass and takes up space. Everything that you see in front of you is matter. There are even things that are matter that you can't see, such as air. Even though you can't see air, it has mass and takes up space. The diagram below shows one way to classify matter. See explanations of the different types of substances below the diagram.

An **element** is a substance that can't be broken down into simpler substances. In order to know whether something is an element, look at a periodic table. Each box on the periodic table represents a different kind of element. If the substance is on the periodic table, it is an element.

A **compound** is a combination of two or more elements. For example, water is a compound. It is made up of both hydrogen and oxygen, which are elements.

A **pure substance** is something that is made up of only one element or compound. Iron is a pure substance that is an element, whereas water is an example of a pure substance that is a compound made up of two elements. There are other pure substances that are compounds made up of many elements.

Mixtures are made up of at least two different compounds or elements that are physically blended together. The substances are not combined chemically, so it is possible to separate a mixture into its individual substances. There are two types of mixtures.

Homogeneous mixtures are those in which the substances are evenly mixed. They have the same composition throughout. Examples include apple juice, steel, and liquid soup.

Heterogeneous mixtures are those that are not uniform throughout. A sample taken from one part of the mixture will have different proportions of substances than a sample taken from another part of the mixture. Examples include sand, vegetable soup, and blood.
