**Fundamentals of Applied Pathophysiology** Ian Peate, 2017-07-13 Fundamentals of Applied Pathophysiology continues to be an accessible and comprehensive introductory text to pathophysiology written specifically for nursing and healthcare students to assist in the understanding of human anatomy and the complex disease patterns that affect normal physiology Thoroughly updated and with full colour illustrations throughout this new edition incorporates additional learning features including reflective questions at the end of each chapter investigation boxes medication alerts red flags to indicate essential information to be aware of when providing care vital signs boxes relating to physiological measurements as well as inclusion of the National Early Warning Score With emphasis placed on a multidisciplinary approach Fundamentals of Applied Pathophysiology highlights the importance of contemporary safe and effective practice in an environment in which the delivery of care is constantly evolving **Microbiology for the Healthcare Professional - E-Book** Karin C.

VanMeter, Robert J. Hubert, William G. VanMeter, 2013-08-09 Even if you've never studied chemistry or biology before this straightforward text makes microbiology easy to learn and helps you understand the spread control and prevention of infections Content is logically organized and reflects just the right level of detail to give you a solid foundation for success enabling you to connect concepts to real world practice and confidently apply your scientific knowledge to patient care Focuses on just the right amount of information you need to know to save you valuable time Chapter outlines and key terms for every chapter help you study more efficiently Learning objectives clarify chapter goals and guide you through content UNIQUE Why You Need to Know boxes detail the history and everyday relevance of key topics to enhance your understanding UNIQUE Life Application boxes demonstrate how science applies to real world scenarios UNIQUE Medical Highlights boxes emphasize special details and anecdotal information to give you a more comprehensive understanding of pathologic conditions UNIQUE Healthcare Application tables provide quick access to important data on symptoms causes and treatments Review questions at the end of each chapter test your understanding and help you identify areas requiring further study Internet resources listed at the end of every chapter direct you to reliable sources for further research

### Molecular and serological tools for clinical diagnostics of Lyme borreliosis - can the laboratory analysis be improved?

Malin Lager, 2020-10-20 Lyme borreliosis LB is caused by spirochetes within the *Borrelia burgdorferi sensu lato* complex and is the most common tick transmitted disease in the northern hemisphere The transmission of the spirochetes to humans in Europe is done by the *Ixodes ricinus* ticks which can also transmit the relapsing fever species *Borrelia miyamotoi* LB may cause clinical manifestations in the skin in the central nervous system in joints and in the heart Diagnosis of LB is mainly based on the patient's medical history self described symptoms and clinical signs in combination with the detection of *Borrelia* specific antibodies serological methods In some cases issues detection of *Borrelia* specific deoxyribonucleic acid molecular methods may be used as a complement to serology All diagnosed LB infections are treated with antibiotics to

prevent disease progression and most patients fully recover without further sequelae. The overall aims of this thesis were to evaluate molecular and serological tools for laboratory diagnosis of LB with a special focus on Lyme neuroborreliosis (LNB) and to identify potential improvements. The results presented in this thesis showed that the immunoglobulin IgG assays currently in use in northern Europe for detection of antibodies in serum had high diagnostic sensitivity (88 %) together with comparable results both between and within assays. For the IgM assays the diagnostic sensitivity was lower (59 %) with more heterogeneous results. Small variations in diagnostic performance for IgM and IgG were mainly presented for samples within the borderline zone. These results support the theory that separate testing of IgM antibodies in serum has low diagnostic value. However, simultaneous detection in serum and cerebrospinal fluid (CSF) for both IgM and IgG antibodies was essential for the diagnosis of LNB at least for certain assays. So far, to our knowledge, no systematic evaluation and optimisation of the pre-analytical handling of CSF samples before molecular testing has been performed. By use of the precipitate concentrated by moderate centrifugation, extraction of total nucleic acid followed by reverse transcription to complementary deoxyribonucleic acid in combination with the absence of polymerase chain reaction (PCR) inhibitors, detection of *Borrelia garinii*, *Borrelia afzelii*, *Borrelia burgdorferi sensu stricto* and *B. miyamotoi* was possible. These four species are all known to be pathogenic to humans. The results revealed a high analytical sensitivity and specificity for the optimised pre-analytical conditions. The thesis also presents results showing that the real-time PCR protocols currently used in Scandinavia have high analytical sensitivity, specificity and concordance. This indicates that the low diagnostic sensitivity for detection of *Borrelia* in CSF was not a result of poorly designed and evaluated PCR protocols but was possibly due to the low number of spirochetes in the samples. However, to further evaluate the diagnostic performance for detection of *Borrelia* in CSF by PCR, clinical samples need to be evaluated based on our new recommendations for the pre-analytical handling of CSF samples. In conclusion, this thesis presents results revealing that both molecular and serological tools for detection of *Borrelia* have in general high sensitivity and specificity with results comparable between different protocols and different laboratories. It also presents recommendations for pre-analytical handling of CSF samples before PCR analysis and shows the benefits in diagnostic performance by simultaneous detection of IgM and IgG antibodies in serum and CSF for accurate diagnosis of LNB. Even though the techniques mentioned above have high analytical performance, the ability to discriminate an active infection from a previous one is limited and further studies need to be carried out. These studies need to focus on finding diagnostic tools that can help physicians to determine ongoing infection to ensure adequate treatment. It is also desirable to improve the standardisation of the diagnostic tools and to find methods that can discriminate between different *Borrelia* species. *Borrelia* is den vanligaste fästingöverförda sjukdomen på norra halvklotet och orsakas av bakterier inom *Borrelia burgdorferi sensu lato* gruppen. Fästingarna överför bakterier till människor i Europa skär via *Ixodes ricinus*. Fästingar vilka överför bakterien *Borrelia miyamotoi* som ger terfällsfeber. *Borrelia*-infektioner uppvisar kliniska uttryck i huden i det centrala
