

Meiosis I

Prophase I. Condensed chromosomes condense. Homologous chromosomes pair up and disengage sites as chromatids of homologous exchange parts. The nuclear envelope disintegrates, and spindle microtubules form.

Metaphase I. Homologous chromosomes line up along the equator of the cell. One homologous of each pair faces each pole of the cell and attached to spindle microtubules via its kinetochores.

Anaphase I. Homologous separate, one member of each pair going to each pole of the cell. Sister chromatids do not separate.

The details of meiotic cell division
In meiotic cell division (meiosis and cytokinesis), the homologous chromosomes of a diploid cell are separated, producing four haploid daughter cells. Each daughter cell contains one member of each pair of parental homologous chromosomes. In these diagrams, two pairs of homologous chromosomes are shown, large and small. The red chromosomes are from one parent (for example, the father), and the blue chromosomes are from the other parent.

Meiosis II

Prophase II. 4 chromosomes have relaxed after telophase I. They recondense. Spindle microtubules re-form and attach to the outer chromatids.

Metaphase II. Chromosomes line up along the equator, with outer chromatids of each chromosome attached to spindle microtubules that lead to opposite poles.

Anaphase II. Chromatids separate into independent daughter chromosomes, one former chromatid moving toward each pole.

Telophase II. Chromosomes from moving to opposite poles. Nuclear envelopes re-form, and the chromosomes become extended again. Cytokinesis (not shown here) results in four haploid cells, each containing one member of each pair of homologous chromosomes.

Bio-inspired Networking Daniel Câmara, 2015-08-19 Bio inspired techniques are based on principles or models of biological systems. In general, natural systems present remarkable capabilities of resilience and adaptability. In this book, we explore how bio-inspired methods can solve different problems linked to computer networks. Future networks are expected to be autonomous, scalable, and adaptive. During millions of years of evolution, nature has developed a number of different systems that present these and other characteristics required for the next generation networks. Indeed, a series of bio-inspired methods have been successfully used to solve the most diverse problems linked to computer networks. This book presents some of these techniques from a theoretical and practical point of view. Discusses the key concepts of bio-inspired networking to aid you in finding efficient networking solutions. Delivers examples of techniques both in theoretical concepts and practical applications. Helps you apply nature's dynamic resource and task management to your computer networks.
