**Arithmetic Differential Equations** Alexandru Buium, 2005 For most of the book the only prerequisites are the basic facts of algebraic geometry and number theory BOOK JACKET *Equations and Inequalities* Jiri Herman, Radan Kucera, Jaromir Simsa, 2000-03-23 A look at solving problems in three areas of classical elementary mathematics equations and systems of equations of various kinds algebraic inequalities and elementary number theory in particular divisibility and diophantine equations In each topic brief theoretical discussions are followed by carefully worked out examples of increasing difficulty and by exercises which range from routine to rather more challenging problems While it emphasizes some methods that are not usually covered in beginning university courses the book nevertheless teaches techniques and skills which are useful beyond the specific topics covered here With approximately 330 examples and 760 exercises *Math Formulas and Equations for Students* Peter I. Kattan, 2023-12-29 This is a little book for students who wish to have the essential formulas and equations of mathematics in a single easily accessible source In about 50 pages the 350 most essential mathematical formulas are listed Unlike other large books on this topic there is no need to go through hundreds of pages and thousands of formulas for the student to get the basic equations The author has searched several books on mathematical formulas and tables and selected only those equations which are essential to the student The mathematical formulas and equations listed in this book are useful for students and researchers in various fields including mathematics physics engineering etc Only the most elementary and basic topics are covered including formulas for various geometric shapes several types of functions trigonometric hyperbolic exponential logarithmic etc the quadratic equation analytic geometry derivatives and integrals arithmetic series geometric series and Taylor series *Geometric Theorems, Diophantine Equations, and Arithmetic Functions* J. Bruce King, 2009-01-16 One of the landmarks in the history of mathematics is the proof of the nonexistence of algorithms based solely on radicals and elementary arithmetic operations addition subtraction multiplication and division for solutions of general algebraic equations of degrees higher than four This proof by the French mathematician Evariste Galois in the early nineteenth century used the then novel concept of the permutation symmetry of the roots of algebraic equations and led to the invention of group theory an area of mathematics now nearly two centuries old that has had extensive applications in the physical sciences in recent decades The radical based algorithms for solutions of general algebraic equations of degrees 2 quadratic equations 3 cubic equations and 4 quartic equations have been well known for a number of centuries The quadratic equation algorithm uses a single square root the cubic equation algorithm uses a square root inside a cube root and the quartic equation algorithm combines the cubic and quadratic equation algorithms with no new features The details of the formulas for these equations of degree  $d$   $d \geq 2$   $3$   $4$  relate to the properties of the corresponding symmetric groups  $S_d$  which are isomorphic to the symmetries of the equilateral triangle for  $d = 3$  and the regular tetrahedron for  $d = 4$  Equational Arithmetic Applied to Questions of Interest, Annuities,
