Hlava, 2022-06-01 This book is the third of a three part series on taxonomies and covers putting your taxonomy into use in as many ways as possible to maximize retrieval for your users Chapter 1 suggests several items to research and consider before you start your implementation and integration process It explores the different pieces of software that you will need for your system and what features to look for in each Chapter 2 launches with a discussion of how taxonomy terms can be used within a workflow connecting two or more taxonomies and intelligent coordination of platforms and taxonomies Microsoft SharePoint is a widely used and popular program and I

consider their use of taxonomies in this chapter Following that is a discussion of taxonomies and semantic integration and then the relationship between indexing and the hierarchy of a taxonomy Chapter 3 How is a Taxonomy Connected to Search provides discussions and examples of putting taxonomies into use in practical applications It discusses displaying content based on search how taxonomy is connected to search using a taxonomy to guide a searcher tools for search including search engines crawlers and spiders and search software the parts of a search capable system and then how to assemble that search capable system This chapter also examines how to measure quality in search the different kinds of search and theories on search from several famous theoreticians two from the 18th and 19th centuries and two contemporary Following that is a section on inverted files parsing discovery and clustering While you probably don't need a comprehensive understanding of these concepts to build a solid workable system enough information is provided for the reader to see how they fit into the overall scheme This chapter concludes with a look at faceted search and some possibilities for search interfaces Chapter 4 Implementing a Taxonomy in a Database or on a Website starts where many content systems really should with the authors or at least the people who create the content This chapter discusses matching up various groups of related data to form connections data visualization and text analytics and mobile and e commerce applications for taxonomies Finally Chapter 5 presents some educated guesses about the future of knowledge organization Table of Contents List of Figures Preface Acknowledgments On Your Mark Get Ready WAIT Things to Know Before You Start the Implementation Step Taxonomy and Thesaurus Implementation How is a Taxonomy Connected to Search Implementing a Taxonomy in a Database or on a Website What Lies Ahead for Knowledge Organization Glossary End Notes Author Biography

**Click Models for Web Search** Aleksandr Chuklin,Ilya Markov,Maarten de Rijke,2022-05-31 With the rapid growth of web search in recent years the problem of modeling its users has started to attract more and more attention of the information retrieval community This has several motivations By building a model of user behavior we are essentially developing a better understanding of a user which ultimately helps us to deliver a better search experience A model of user behavior can also be used as a predictive device for non observed items such as document relevance which makes it useful for improving search result ranking Finally in many situations experimenting with real users is just infeasible and hence user simulations based on accurate models play an essential role in understanding the implications of algorithmic changes to search engine results or presentation changes to the search engine result page In this survey we summarize advances in modeling user click behavior on a web search engine result page We present simple click models as well as more complex models aimed at capturing non trivial user behavior patterns on modern search engine result pages We discuss how these models compare to each other what challenges they have and what ways there are to address these challenges We also study the problem of evaluating click models and discuss the main applications of click models

Simulating Information Retrieval Test Collections David Hawking,Bodo Billerbeck,Paul Thomas,Nick Craswell,2022-06-01 Simulated test collections may find application in situations

where real datasets cannot easily be accessed due to confidentiality concerns or practical inconvenience They can potentially support Information Retrieval IR experimentation tuning validation performance prediction and hardware sizing Naturally the accuracy and usefulness of results obtained from a simulation depend upon the fidelity and generality of the models which underpin it The fidelity of emulation of a real corpus is likely to be limited by the requirement that confidential information in the real corpus should not be able to be extracted from the emulated version We present a range of methods exploring trade offs between emulation fidelity and degree of preservation of privacy We present three different simple types of text generator which work at a micro level Markov models neural net models and substitution ciphers We also describe macro level methods where we can engineer macro properties of a corpus giving a range of models for each of the salient properties document length distribution word frequency distribution for independent and non independent cases word length and textual representation and corpus growth We present results of emulating existing corpora and for scaling up corpora by two orders of magnitude We show that simulated collections generated with relatively simple methods are suitable for some purposes and can be generated very quickly Indeed it may sometimes be feasible to embed a simple lightweight corpus generator into an indexer for the purpose of efficiency studies Naturally a corpus of artificial text cannot support IR experimentation in the absence of a set of compatible queries We discuss and experiment with published methods for query generation and query log emulation We present a proof of the pudding study in which we observe the predictive accuracy of efficiency and effectiveness results obtained on emulated versions of TREC corpora The study includes three open source retrieval systems and several TREC datasets There is a trade off between confidentiality and prediction accuracy and there are interesting interactions between retrieval systems and datasets Our tentative conclusion is that there are emulation methods which achieve useful prediction accuracy while providing a level of confidentiality adequate for many applications Many of the methods described here have been implemented in the open source project SynthaCorpus accessible at <https://bitbucket.org/davidhawking/synthacorporus>

Quantifying Research Integrity Michael Seadle, 2022-05-31 Institutions typically treat research integrity violations as black and white right or wrong The result is that the wide range of grayscale nuances that separate accident carelessness and bad practice from deliberate fraud and malpractice often get lost This lecture looks at how to quantify the grayscale range in three kinds of research integrity violations plagiarism data falsification and image manipulation Quantification works best with plagiarism because the essential one to one matching algorithms are well known and established tools for detecting when matches exist Questions remain however of how many matching words of what kind in what location in which discipline constitute reasonable suspicion of fraudulent intent Different disciplines take different perspectives on quantity and location Quantification is harder with data falsification because the original data are often not available and because experimental replication remains surprisingly difficult The same is true with image manipulation where tools exist for detecting certain kinds of manipulations but where the tools are

also easily defeated This lecture looks at how to prevent violations of research integrity from a pragmatic viewpoint and at what steps can institutions and publishers take to discourage problems beyond the usual ethical admonitions There are no simple answers but two measures can help the systematic use of detection tools and requiring original data and images These alone do not suffice but they represent a start The scholarly community needs a better awareness of the complexity of research integrity decisions Only an open and wide spread international discussion can bring about a consensus on where the boundary lines are and when grayscale problems shade into black One goal of this work is to move that discussion forward

**Researching Serendipity in Digital Information Environments** Lori McCay-Peet, Elaine G. Toms, 2022-05-31 Chance luck and good fortune are the usual go to descriptors of serendipity a phenomenon aptly often coupled with famous anecdotes of accidental discoveries in engineering and science in modern history such as penicillin Teflon and Post it notes Serendipity however is evident in many fields of research in organizations in everyday life and there is more to it than luck implies While the phenomenon is strongly associated with in person interactions with people places and things most attention of late has focused on its preservation and facilitation within digital information environments Serendipity's association with unexpected positive user experiences and outcomes has spurred an interest in understanding both how current digital information environments support serendipity and how novel approaches may be developed to facilitate it Research has sought to understand serendipity how it is manifested in people's personality traits and behaviors how it may be facilitated in digital information environments such as mobile applications and its impacts on an individual an organizational and a wider level Because serendipity is expressed and understood in different ways in different contexts multiple methods have been used to study the phenomenon and evaluate digital information environments that may support it This volume brings together different disciplinary perspectives and examines the motivations for studying serendipity the various ways in which serendipity has been approached in the research methodological approaches to build theory and how it may be facilitated Finally a roadmap for serendipity research is drawn by integrating key points from this volume to produce a framework for the examination of serendipity in digital information environments

**Interactive IR User Study Design, Evaluation, and Reporting** Jiqun Liu,Chirag Shah,2022-05-31 Since user study design has been widely applied in search interactions and information retrieval IR systems evaluation studies a deep reflection and meta evaluation of interactive IR IIR user studies is critical for sharpening the instruments of IIR research and improving the reliability and validity of the conclusions drawn from IIR user studies To this end we developed a faceted framework for supporting user study design reporting and evaluation based on a systematic review of the state of the art IIR research papers recently published in several top IR venues n 462 Within the framework we identify three major types of research focuses extract and summarize facet values from specific cases and highlight the under reported user study components which may significantly affect the results of research Then we employ the faceted framework in evaluating a series of IIR user studies against their respective research questions and explain the roles and impacts of the underlying connections and collaborations among different facet values Through bridging diverse combinations of facet values with the study design decisions made for addressing research problems the faceted framework can shed light on IIR user study design reporting and evaluation practices and help students and young researchers design and assess their own studies

**Predicting Information Retrieval Performance** Robert M. Losee,2022-05-31 Information Retrieval performance measures are usually retrospective in nature representing the effectiveness of an experimental process However in the sciences phenomena may be predicted given parameter values of the system After developing a measure that can be applied retrospectively or can be predicted performance of a system using a single term can be predicted given several different types of probabilistic distributions Information Retrieval performance can be predicted with multiple terms where statistical dependence between terms exists and is understood These predictive models may be applied to realistic problems and then the results may be used to validate the accuracy of the methods used The

application of metadata or index labels can be used to determine whether or not these features should be used in particular cases Linguistic information such as part of speech tag information can increase the discrimination value of existing terminology and can be studied predictively This work provides methods for measuring performance that may be used predictively Means of predicting these performance measures are provided both for the simple case of a single term in the query and for multiple terms Methods of applying these formulae are also suggested

we review the rapid transform of scholarly collaboration on various academic social web platforms and examine how these platforms have facilitated academics throughout their research lifecycle from forming ideas collecting data and authoring articles to disseminating findings We refer to the term academic social web platforms in this book as a category of Web 2.0 tools or online platforms such as CiteULike Mendeley Academia.edu and ResearchGate that enable and facilitate scholarly information exchange and participation We will also examine scholarly collaboration behaviors including sharing academic resources exchanging opinions following each other's research keeping up with current research trends and most importantly building up their professional networks Inspired by the model developed Olson et al 2000 on factors for successful scientific collaboration our examination of the status of scholarly collaboration on the academic social web has four emphases technology readiness coupling work building common ground and collaboration readiness Finally we talk about the insights and challenges of all these online scholarly collaboration activities imposed on the research communities who are engaging in supporting online scholarly collaboration This book aims to help researchers and practitioners understand the development of scholarly collaboration on the academic social web and to build up an active community of scholars who are interested in this topic

*Fuzzy Information Retrieval* Donald H. Kraft, Erin Colvin, 2022-06-01

Information retrieval used to mean looking through thousands of strings of texts to find words or symbols that matched a user's query Today there are many models that help index and search more effectively so retrieval takes a lot less time Information retrieval IR is often seen as a subfield of computer science and shares some modeling applications storage applications and techniques as do other disciplines like artificial intelligence database management and parallel computing This book introduces the topic of IR and how it differs from other computer science disciplines A discussion of the history of modern IR is briefly presented and the notation of IR as used in this book is defined The complex notation of relevance is discussed Some applications of IR is noted as well since IR has many practical uses today Using information retrieval with fuzzy logic to search for software terms can help find software components and ultimately help increase the reuse of software This is just one practical application of IR that is covered in this book Some of the classical models of IR is presented as a contrast to extending the Boolean model This includes a brief mention of the source of weights for the various models In a typical retrieval environment answers are either yes or no i.e. on or off On the other hand fuzzy logic can bring in a degree of match vs a crisp i.e. strict match This too is looked at and explored in much detail showing how it can be applied to information retrieval Fuzzy logic is often times considered a soft computing application and this book explores how IR with fuzzy logic and its membership functions as weights can help indexing querying and matching Since fuzzy set theory and logic is explored in IR systems the explanation of where the fuzz is ensues The concept of relevance feedback including pseudorelevance feedback is explored for the various models of IR For the extended Boolean model the use of genetic algorithms for relevance feedback is delved into The concept of query expansion is explored using rough set theory Various

term relationships is modeled and presented and the model extended for fuzzy retrieval An example using the UMLS terms is also presented The model is also extended for term relationships beyond synonyms Finally this book looks at clustering both crisp and fuzzy to see how that can improve retrieval performance An example is presented to illustrate the concepts

Learning from Multiple Social Networks Liqiang Nie,Xuemeng Song,Tat-Seng Chua,2022-05-31 With the proliferation of social network services more and more social users such as individuals and organizations are simultaneously involved in multiple social networks for various purposes In fact multiple social networks characterize the same social users from different perspectives and their contexts are usually consistent or complementary rather than independent Hence as compared to using information from a single social network appropriate aggregation of multiple social networks offers us a better way to comprehensively understand the given social users Learning across multiple social networks brings opportunities to new services and applications as well as new insights on user online behaviors yet it raises tough challenges

- 1 How can we map different social network accounts to the same social users
- 2 How can we complete the item wise and block wise missing data
- 3 How can we leverage the relatedness among sources to strengthen the learning performance
- 4 How can we jointly model the dual heterogeneities multiple tasks exist for the given application and each task has various features from multiple sources

These questions have been largely unexplored to date We noticed this timely opportunity and in this book we present some state of the art theories and novel practical applications on aggregation of multiple social networks In particular we first introduce multi source dataset construction We then introduce how to effectively and efficiently complete the item wise and block wise missing data which are caused by the inactive social users in some social networks We next detail the proposed multi source mono task learning model and its application in volunteerism tendency prediction As a counterpart we also present a mono source multi task learning model and apply it to user interest inference We seamlessly unify these models with the so called multi source multi task learning and demonstrate several application scenarios such as occupation prediction Finally we conclude the book and figure out the future research directions in multiple social network learning including the privacy issues and source complementarity modeling This is preliminary research on learning from multiple social networks and we hope it can inspire more active researchers to work on this exciting area If we have seen further it is by standing on the shoulders of giants

**Dynamic Information Retrieval Modeling** Grace Hui Yang,Marc Sloan,Jun Wang,2022-05-31 Big data and human computer information retrieval HCIR are changing IR They capture the dynamic changes in the data and dynamic interactions of users with IR systems A dynamic system is one which changes or adapts over time or a sequence of events Many modern IR systems and data exhibit these characteristics which are largely ignored by conventional techniques What is missing is an ability for the model to change over time and be responsive to stimulus Documents relevance users and tasks all exhibit dynamic behavior that is captured in data sets typically collected over long time spans and models need to respond to these changes Additionally the size of

modern datasets enforces limits on the amount of learning a system can achieve Further to this advances in IR interface personalization and ad display demand models that can react to users in real time and in an intelligent contextual way In this book we provide a comprehensive and up to date introduction to Dynamic Information Retrieval Modeling the statistical modeling of IR systems that can adapt to change We define dynamics what it means within the context of IR and highlight examples of problems where dynamics play an important role We cover techniques ranging from classic relevance feedback to the latest applications of partially observable Markov decision processes POMDPs and a handful of useful algorithms and tools for solving IR problems incorporating dynamics The theoretical component is based around the Markov Decision Process MDP a mathematical framework taken from the field of Artificial Intelligence AI that enables us to construct models that change according to sequential inputs We define the framework and the algorithms commonly used to optimize over it and generalize it to the case where the inputs aren't reliable We explore the topic of reinforcement learning more broadly and introduce another tool known as a Multi Armed Bandit which is useful for cases where exploring model parameters is beneficial Following this we introduce theories and algorithms which can be used to incorporate dynamics into an IR model before presenting an array of state of the art research that already does such as in the areas of session search and online advertising Change is at the heart of modern Information Retrieval systems and this book will help equip the reader with the tools and knowledge needed to understand Dynamic Information Retrieval Modeling
