Ivanov-Kholodny, A.V. Mikhailov, 2012-12-06 The ionosphere of the Earth has been actively studied since the 1920 s following the discovery of ground radio sounding By means of this method results were obtained by an international network of ionospheric stations in particular by the successful implementation of a number of rigorously planned international scientific research programs enabling the collection of extensive experimental material on some of the most important parameters of the ionosphere the critical frequencies of E F1 and F2 layers Comprehensive analyses of these observation data give a fairly complete picture of the various changes taking place in the principal ionospheric layers at different points on our globe Another important aspect of the study of the ionosphere which has been in progress for the past three decades is an extensive program of in situ determinations of the various physical parameters first using rockets and subsequently artificial satellites The data thus obtained on the principal ionizing agent short wave solar radiation and on the physical conditions prevailing in the upper atmosphere and in the ionosphere at different altitudes allow the proposal of a self consistent mechanism of ionosphere formation A general outline of the theory of ionosphere formation at different altitudes is now complete Its application to specific cases dependent on a more accurate determination of input parameters to give solutions valid for a definite set of conditions etc is yet to be accomplished The use of artificial satellites in cosmic research yielded abundant scientific data Library of Congress Subject Headings Library of Congress.
