CAD/CAM Robotics and Factories of the Future Birendra Prasad, 2012-12-06 This volume is about automation automation in design automation in manufacturing and automation in production Automation is essential for increased productivity of quality products at reduced costs That even partial or piecemeal automation of a production facility can deliver dramatic improvements in productivity has been amply demonstrated in many a real life situation Hence currently great efforts are being devoted to research and development of general as well special methodologies of and tools for automation This volume reports on some of these methodologies and tools In general terms methodologies for automation can be divided into two groups There are situations where a process whether open loop or closed loop is fairly clearly understood In such a situation it is possible to create a mathematical model and to prescribe a mathematical procedure to optimize the output If such mathematical models and procedures are computationally tractable we call the corresponding automation algorithmic or parametric programming There is however a second set of situations which include processes that are not well understood and the available mathematical models are only approximate and discrete While there are others for which mathematical procedures are so complex and disjoint that they are computationally intractable These are the situations for which heuristics are quite suitable for automation We choose to call such automation

**in the Mechanics of Plates and Shells** D. Durban, Dan Givoli, J.G. Simmonds, 2006-04-11 The optimal control of flexible structures is an active area of research The main body of work in this area is concerned with the control of time dependent displacements and stresses and assumes linear elastic conditions namely linear elastic material behavior and small deformation See e g 1 3 the collections of papers 4 5 and references therein On the other hand in the present paper we consider the static optimal control of a structure made of a nonlinear elastic material and undergoing large deformation An important application is the suppression of static or quasi static elastic deformation in flexible space structures such as parts of satellites by the use of control loads 6 Solar radiation and radiation from other sources induce a temperature field in the structure which in turn generates an elastic displacement field The displacements must usually satisfy certain limitations dictated by the allowed working conditions of various orientation sensitive instruments and antennas in the space vehicle For example a parabolic reflector may cease to be effective when undergoing large deflection The elastic deformation can be reduced by use of control loads which may be implemented via mechanically based actuators or more modern piezoelectric devices When the structure under consideration is made of a rubber like material and is undergoing large deformation nonlinear material and geometric effects must be taken into account in the analysis **Aspect '94** Society for Underwater Technology
