[Preservatives in Historic Structures](#) Stan T. Lebow,2012 This document provides guidance on wood preservation options in the context of historic preservation Preserving wooden building materials is critical to historic preservation practitioners Biodeterioration can be minimized through design construction practices maintenance and if necessary by use of wood preservatives Moisture is the primary cause of biodeterioration and if exposure to moisture cannot be prevented the application of preservatives or use of pressure treated wood may be warranted The Secretary of Interior s Standards for the Treatment of Historic Properties emphasize retaining the historic character of a property including distinctive materials features and spatial relationships Existing conditions should be carefully evaluated to determine the appropriate level of intervention Wood preservatives are generally grouped into two categories preservatives used for in place field remedial treatment and preservatives used for pressure treatments A limitation of in place treatments is that they cannot be forced deeply into the wood under pressure However they can be applied into the center of large wooden members via treatment holes These preservatives may be available as liquids rods or pastes Pressure treated wood has much deeper and more uniform preservative penetration than wood treated with other methods The type of pressure treated wood is often dependent on the requirements of the specific application To guide selection of pressure treated wood the American Wood Protection Association developed Use Category System standards Other preservative characteristics such as color odor and surface oiliness may also be relevant Guidelines for selection and application of field treatments and for selection and specification of pressure treated wood are provided in this document **Guide for Use of Wood Preservatives in**

Historic Structures Stan LeBow,Ronald W. Anthony,2012-12-13 NOTE NO FURTHER DISCOUNT FOR THIS PRINT PRODUCT OVERSTOCK SALE Significantly reduced list price Wood preservatives are generally grouped into two categories preservatives used for in place field remedial treatment and preservatives used for pressure treatments A limitation of in place treatments is that they cannot be forced deeply into the wood under pressure However they can be applied into the

center of large wooden members via treatment holes. These preservatives may be available as liquids, rods, or pastes. Pressure-treated wood has much deeper and more uniform preservative penetration than wood treated with other methods. The type of pressure-treated wood is often dependent on the requirements of the specific application. To guide selection of pressure-treated wood, the American Wood Protection Association developed Use Category System standards. Other preservative characteristics such as color, odor, and surface oiliness may also be relevant. Guidelines for selection and application of field treatments and for selection and specification of pressure-treated wood are provided in this document.

Guide to Effective Monitoring of Aquatic and Riparian Resources, 2004. This monitoring plan for aquatic and riparian resources was developed in response to monitoring needs addressed in the Biological Opinions for bull trout (U.S. Department of the Interior Fish and Wildlife Service 1998) and steelhead (U.S. Department of Commerce National Marine Fisheries Service). It provides a consistent framework for implementing the effectiveness monitoring of aquatic and riparian resources within the range of the Pacific Anadromous Fish Strategy (PACFISH) and the Inland Fish Strategy (INFISH). The primary objective is to evaluate the effect of land management activities on aquatic and riparian communities at multiple scales and to determine whether PACFISH/INFISH management practices are effective in maintaining or improving the structure and function of riparian and aquatic conditions at both the landscape and watershed scales on Federal lands throughout the upper Columbia River Basin. A list of attributes thought to be important in defining aquatic and riparian habitat conditions and their relationship with listed species were identified. The list of attributes was then translated into measurable criteria and compiled to form sampling protocols for both stream channel parameters (Part II) and vegetation parameters (Part III). These sampling methods were tested for variability and the results are documented in two other publications: *Testing Common Stream Sampling Methods for Broad Scale Long Term*

Guidelines for Evaluating Air Pollution Impacts on Class I Wilderness Areas in California David Lawrence Peterson, 1992 The 1977 Clean Air Act legally mandated the prevention of significant deterioration PSD of air quality related values AQRVs on wilderness lands Federal land managers are assigned the task of protecting these wilderness values This report contains guidelines for determining the potential effects of incremental increases in air pollutants on natural resources in wilderness areas of the National Forests of California These guidelines are based on current information about the effects of ozone sulfur and nitrogen on AQRVs Knowledge based methods were used to elicit these guidelines from scientists and resource managers in a workshop setting Linkages were made between air pollutant deposition and level of deterioration of specific features sensitive receptors of AQRVs known to be sensitive to pollutants Terrestrial AQRVs include a wide number of ecosystem types as well as geological and cultural values Ozone is already high enough to injure conifers in large areas of California and is a major threat to terrestrial AQRVs Aquatic AQRVs include lakes and streams mostly in high elevation locations Current sulfur and nitrogen deposition is probably too low to warrant immediate concern in most areas with the exception of nitrogen deposition at some locations in southern California although the low buffer capacity of many aquatic systems in California makes them sensitive to potential future increases in acidity Visibility is considered as a discrete AQRV Guidelines are presented for determining degradation of visibility based on sensitive views in wilderness areas Estimates of current deposition of ozone sulfur and nitrogen are compiled for all California wilderness areas Recommendations are included for resource monitoring data collection and decision criteria with respect to the disposition of permit applications
