

Neuron Structure: What are the essential structures that make up a neuron?

Why?

Cells are specialized for different functions in multicellular organisms. In animals, one unique kind of cell helps organisms survive by collecting information and sending messages throughout the body. The shapes and features of neurons, which are the primary cells in the nervous system, enable animals to experience all of the five senses; find food, mates, and shelter, and to survive in their diverse environments.

Model 1 – Parts of a Neuron

1. Model 1 is an illustration of two neurons. Label one of the neurons in the diagram with the following structures:
Cell body or soma
Axon

Cell nucleus
Synapse
Dendrites

2. Which structure(s) on the neurons in Model 1 would receive a signal from either a sensory cell (taste bud, touch receptor, retinal cell) or from another neuron?
3. Draw an arrow through the two cells in Model 1 to show the path of a nerve impulse if a message was being sent through the two neurons.

Model 2 – Membrane Potential

4. Describe the cellular structure shown in detail in Model 2.

5. Identify each of these symbols in Model 2.

6. Consider Model 2.

- a. Which side of the membrane has more sodium ions when the neuron is at rest?
- b. Briefly explain why sodium ions cannot cross the membrane without the use of a protein channel.
- c. Which direction should sodium ions flow naturally if a channel is provided?

brains construct themselves from simple beginnings in the early embryo to become the most complex living structures on the planet. It explains how cells first become neural, how their proliferation is controlled, what regulates the types of neural cells they become, how neurons connect to each other, how these connections are later refined under the influence of neural activity, and why some neurons normally die. This student friendly guide stresses and justifies the generally held belief that a greater knowledge of how nervous systems construct themselves will help us find new ways of treating diseases of the nervous system that are thought to originate from faulty development such as autism spectrum disorders, epilepsy and schizophrenia. A concise illustrated guide focusing on core elements and emphasizing common principles of developmental mechanisms, supplemented by suggestions for further reading. Text boxes provide detail on major advances, issues of particular uncertainty or controversy and examples of human diseases that result from abnormal development. Introduces the methods for studying neural development, allowing the reader to understand the main evidence underlying research advances. Offers a balanced mammalian/non-mammalian perspective and emphasizes mechanisms that are conserved across species, drawing on examples from model organisms like the fruit fly, nematode, worm, frog, zebrafish, chick, mouse and human.
