

2. Examine the accompanying photo and complete the following:

- a. What type of volcano is shown here? What features helped you classify it as such?

Based on my observation, it is a stratovolcano because of its steep profile, height, and conical shape.

- b. What is the eruptive style of such volcanoes? Describe the likely composition and viscosity of its magma.

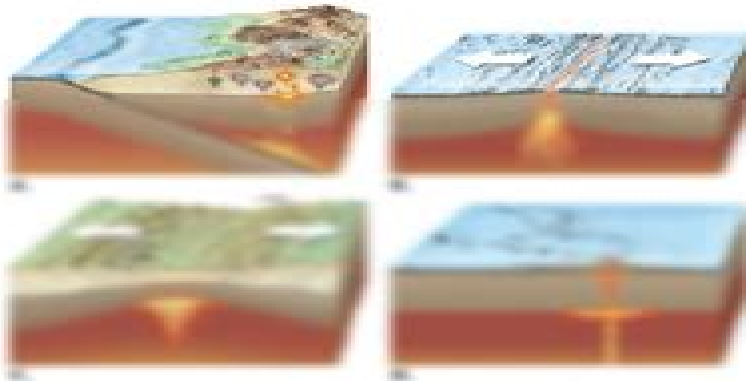

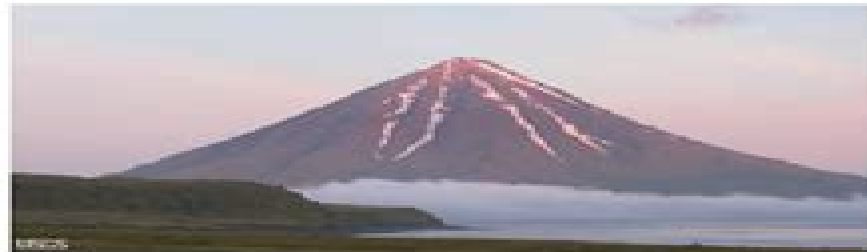

Stratovolcanoes violently erupt when it shoots lava out of their crater. The magma is composed of felsic minerals, and it has high silica content that makes it viscous and thick.

- c. Which type of plate boundary is the likely setting for this volcano?

The plate boundary setting of this volcano is likely a convergent boundary.

- d. Name a city that is vulnerable to the effects of a volcano of this type.

In such a setting, the Legazpi City near the Mayon volcano is mostly highly vulnerable to such effects when the volcano erupts.

3. For each of the accompanying four sketches, identify the geologic setting (zone of volcanism). Which of these settings will most likely generate explosive eruptions? Which will produce an outpouring of fluid basaltic lava?

(A.) Image is convergent plate volcanism which is a continental volcano arc. (B.) Image is divergent plate volcanism which is an oceanic ridge. (C.) Image is divergent plate volcanism which is a continental rift, and (D.) Image is convergent volcanism which is oceanic. The one that would probably generate an explosive eruptions is the convergent plate volcanism. In the illustration of (A.) the convergent plate

boundary, the slabs of oceanic crust sink deeper into the mantle. Hence, the increase in temperature and pressure drive volatiles (mostly water) from the oceanic crust. The magma becomes more viscous because of the increased temperature, so when it erupts, it erupts. While the (C.) & (D.), which are divergent plate volcanisms, would then be the ones to produce an outpouring of fluid basaltic lava because it has a wide crater and low viscosity with a high temperature.

4. Assume that you are monitoring a volcano that has erupted several times in the recent past but appears to be quiet now. How might you determine whether magma moves through the crust beneath the volcano? Suggest at least two phenomena you would observe or measure.

If I monitor the volcano, I'd probably check the escaping gases from the vents. It could help determine if the magma moves close to the surface or not, then compare it with any other recorded data and observations to determine if there are temperature changes. Next, I'd observe the area close to the

Plato's Fable Joshua Mitchell, 2009-01-10 This book is an exploration of Plato s Republic that bypasses arcane scholarly debates Plato s Fable provides refreshing insight into what in Plato s view is the central problem of life the mortal propensity to adopt defective ways of answering the question of how to live well How in light of these tendencies can humankind be saved Joshua Mitchell discusses the question in unprecedented depth by examining one of the great books of Western civilization He draws us beyond the ancients moderns debate and beyond the notion that Plato s Republic is best understood as shedding light on the promise of discursive democracy Instead Mitchell argues the question that ought to preoccupy us today is neither reason nor discourse but rather imitation To what extent is man first and foremost an imitative being This Mitchell asserts is the subtext of the great political and foreign policy debates of our times Plato s Fable is not simply a work of textual exegesis It is an attempt to move debates within political theory beyond their current location Mitchell recovers insights about the depth of the problem of mortal imitation from Plato s magnificent work and seeks to explicate the meaning of Plato s central claim that only philosophy can save us
