Modeling Necmi K. Avkiran, Christian M. Ringle, 2018-02-16 This book pulls together robust practices in Partial Least Squares Structural Equation Modeling PLS SEM from other disciplines and shows how they can be used in the area of Banking and Finance In terms of empirical analysis techniques Banking and Finance is a conservative discipline As such this book will raise awareness of the potential of PLS SEM for application in various contexts PLS SEM is a non parametric approach designed to maximize explained variance in latent constructs Latent constructs are directly unobservable phenomena such as customer service quality and managerial competence Explained variance refers to the extent we can predict say customer service quality by examining other theoretically related latent constructs such as conduct of staff and communication skills Examples of latent constructs at the microeconomic level include customer service quality managerial effectiveness perception of market leadership etc macroeconomic level latent constructs would be found in contagion of systemic risk from one financial sector to another herd behavior among fund managers risk tolerance in financial markets etc Behavioral Finance is bound to provide a wealth of opportunities for applying PLS SEM The book is designed to expose robust processes in application of PLS SEM including use of various software packages and codes including R PLS SEM is already a popular tool in marketing and management information systems used to explain latent constructs Until now PLS SEM has not enjoyed a wide acceptance in Banking and Finance Based on recent research developments this book represents the first collection of PLS SEM applications in Banking and Finance This book will serve as a reference book for those researchers keen on adopting PLS SEM to explain latent constructs in Banking and Finance Systems Biology and Antimicrobial Drug Resistance Vijay Soni ,Saurabh Mishra,Aditya Kumar Sharma,Neha Dubey,2024-09-18 Antimicrobial resistance AMR poses a significant threat to global public health With the emergence of new resistant strains and limited antibiotic treatment options it has become increasingly difficult to treat infections effectively This is particularly concerning for bacterial infections like Mycobacterium tuberculosis Acinetobacter spp Staphylococcus aureus and Pseudomonas aeruginosa where only a limited number of antibiotics are available for treatment According to the US National Strategy for Combating Antibiotic Resistant Bacteria approximately 2 million Americans are infected with antibiotic resistant bacteria each year and at least 23 000 die as a result The situation is even worse in developing countries Systems biology which aims to understand the complex interactions between the different components of a biological system has emerged as a powerful tool for studying AMR By integrating data from multiple sources including genomics transcriptomics proteomics and metabolomics systems biology can provide a comprehensive view of the mechanisms underlying AMR This approach can lead to the identification of novel targets for drug development and the development of personalized treatment strategies that consider the specific characteristics of individual patients and the pathogens that infect them This Research Topic aims to explore the potential of systems biology in combating antibiotic resistance and highlight the need for further research to fully realize its clinical potential in infectious diseases *Graduate Programs in the Humanities, Arts & Social Sciences 2014*

Pseudomonas and Acinetobacter: From Drug Resistance to Pathogenesis Ghassan M. Matar, 2018-05-03 *Pseudomonas aeruginosa* and *Acinetobacter baumannii* are among the most common non lactose fermenting Gram negative pathogens responsible for hospital acquired infections especially in intensive care units ICUs The treatment of infections caused by these bacteria is complicated due to the emergence of multi drug resistance as the two species are noted for their intrinsic resistance to antimicrobial agents and

their ability to acquire genetic elements that encode for resistance determinants In both species resistance to multiple classes of antimicrobial agents can seriously compromise the ability to treat infected patients especially the immunocompromised Consequently very few antimicrobials remain as treatment options Mechanisms of resistance in both of these pathogens include the production of lactamases and aminoglycoside modifying enzymes as well as reduced or lack of expression of outer membrane proteins mutations in topoisomerases and up regulation of efflux pumps To that purpose the findings of the studies included in this book deal with the prevalence of resistant isolates to various antimicrobial agents in both *P. aeruginosa* and *A. baumannii* their underlying mechanisms of resistance their virulence factors their pathogenesis and prospective treatment options Special thanks are due to Mr Bassam El Hafi for facilitating procedures involved in this publication
